There is a mod Stan put in effect approximately April of 2002 which may be relevant here. You should check and see if the date of manufacture of your unit is after or before that date. The modification entails installing a diode in the control board behind the front panel, but I can't remember what diode nor where it goes. I had persistant arc fault problems with my 2000A and went back and forth with Stan on this many times. Finally he suggested I try this diode, but I wasn't able to get one and try it out until fall of 2002. Miraculously, that cured all of my arc fault problems. That was when Stan admitted this had been cut in as a manufacturing change order the previous spring.

I should add, however, that I was having arc fault problems on all band segments--not just one as you are. What made the problem vexing was that I did discover a bad balun on my tribander in the midst of all this investigation. So there were some real antenna problems I was having which were masking a real problem with the amp. As I mentioned, your best bet is to check that you have all the factory mods installed in your amp as a first step.

Carl,
I thought of that but changed everything out. AND it only happens on that band segment 14.000-14.100. I believe it is internal to the amp

If you have a common feedline to the antennas, it could be some corrosion in a common coax connector. I had a problem similar to this and corrosion had set in one of my pl-259's on a feedline shared by several antennas.

Howard,

Have you tried reducing drive to a very low level and been able to
find a power level which does not produce the fault?

If so gradually bring drive up until fault occurs. Without exception
all arc faults here were due to bad/mismatched antenna components.
Since yours seems to be freq dependent, is there something about the
14000-14100 segment which is different? For example, are your
antennas tuned for the high phone band? I will get arc faults here
when trying to run full power in the high phone band. My antennas are
tuned for low CW. The "cure" is to drop the drive to a level which
doesn't trip the amp.

Thank you Bruce for your suggestions. I believe this problem is a bit more specific although I do not have the diode mod installed. I will try Will's ideas and see how they work as soon as I get home. When I get this squared away I will post to the net.

Ok so where, how, etc. does one get the low-down on this amp. mod..???
I have one of the older amps, (bought 2000). I've had the arc fault problem off and on as well. Yep I've got the antenna and feedlines up to snuff....:) Any pointers would be appreciated..!!!

thanks....

Brian,
I can't raise the level sufficiently to center it in the brackets. In other words not sufficient drive to tune it before it faults. In concurrence with your thoughts my sense is that it is not tuning for the segment and therefore causing the arc fault due to mismatch.

How about tuning that section into a dummy load..that would get your
settings in the ball park.. then tune into a real antenna..
Maybe the present settings are just so far off everything looks like a
fault.... 10 watts shouldn't trip the ACOM...you would think.

I have an early Acom 2000A and although I have had arc fault failures from time to time I have found in every case it was an indication that there was a problem either with out of tune, feedline (and components) or for awhile a timing problem between exciter and amp switching. My current problem, just one band segment, gives me the sense that seg is not tuning. Will have more next week when I get the chance to try some of Stan's suggestions.

1027. Strange problem

Yahoo group: acom-list (1999 — 2009)
Date: 2003-09-16 20:22:12 UTC
From: Howard Klein
Topic: 1027 Message: 1027

Hi Will,
Thank you and Stan for the ideas. As Stan suggested erasing the non-volatile memory solved the problem. I imagine that segment got hung up somehow and would not change until the reset. All OK again.
Best Regards to you and the Acom group.
Howard...K2HK

Hello Howard, I forwarded your email to our engineer in Bulgaria and he emailed me the following:

Hello Will,

It seems strange indeed. You can tell Howard the following suggestions:

1. Erase the Nonvolatile Memory (Oper. Manual S.5-7).

2. Check the drive coaxial cable.

3. Do a fresh AUTO TUNE (Oper. Manual S.4-1) and test it again.

4. On (14.0-14.1)MHz note the output power where the problem appears (gradually increasing from a possible minimum). Note the drive power needed at this point.

In the MEASURE sub-menu check the PLATE-RF voltage and the GAIN at a power slightly below that maximum.

5. On the next frequency segment (14.1-14.2MHz) and the same antenna, check the same at the same output level as in (4). Note the drive power at this segment too.

If the problem persists, please give me the measurement results for analysis. Tell him to contact me directly at acom@....

73 de Stan LZ1IU
Sofia, 11 September 2003.

Please follow his instructions and send me the results also.

Best Regards,

Will

Hello,
I had (and still have) a similar problem on 10 MHz, but replacing a rather old tranceiver with a more modern one the
fault disappeared.

It seems that the old one developed a glitch in the output waveform that hurts my Acom 2000; it interferes also with
normal bandswitching.

1029. The strange problem

Yahoo group: acom-list (1999 — 2009)
Date: 2003-09-21 18:13:59 UTC
From: Jim Idelson
Topic: 1029 Message: 1029

I've been working on my 40m antenna this past week, and I was seeing the arc fault message quite frequently. I was about to take the antenna down because over the years I have become so confdent that arc faults can be traced to coax or antenna problems. But, the recent discussion of arc faults made me think again before climbing the tower. Turns out the fault only occurred when I was in the 7.000 to 7.100 segment. 7.099 bad; 7.101 worked fine. I retuned the amp many times, and the arc fault still happened. Then I decided to try the NVRAM reset procedure suggested by Stan. Instead of doing the full reset, I did the less invasive reset that restores only the user settings to the defaults. This worked just fine. I am very pleased - no need to touch the antenna!

The real question is why are these resets necessary?
Are the memory chips starting to fail?
Can we expect these failures in our future?

1032. FWD: Re: [acom-list] The strange problem

Yahoo group: acom-list (1999 — 2009)
Date: 2003-09-21 20:13:15 UTC
From: Jim Idelson
Topic: 1032 Message: 1032

Let me answer all the questions with one message.

1. Brian - I have no idea why this happens, but I don't suspect there is a hardware problem. More likely, the autotune process that over-writes the last settings stored for a segment doesn't rewrite every value. But, when you restore defaults everything is rewritten. Just my guess.

2. Bruce - I used the "CLR" function described in section 5-5 on page 22 of my manual. As I looked over the rest of the manual, I note that you can erase only a specific segment's User setting with the procedure described in section 4-5 of the manual on page 20. This looks like a good first step if you run into the arc problem. It forces you to do the least retuning.

3. Barry - My amp is also a rather [very] early one. This is the first time I'e seen this cause of the arc faults.

RE: Re: [acom-list] The strange problem

FWIW, I have what I believe is the second Acom amp in the US. I bought it May 1999, and no problems here. I know PY5EG and ON4UN got them earlier. I'm sure there are others. Any comments from early amp owners?

Jim,

How about the NV memory "forgets" a bit due to deterioriation or
cosmic radiation? My understanding is that these chips are supposed
to be good for 20 years or so but maybe not. However, I'm really
wondering if we are seeing the edge of the failure distribution.

My amp is a Sept. 2000 vintage one with lots of writes/rewrites of the
antenna settings. No problem --- yet.

Topic: 1032 Message: 1034

I guess I started this thread so my two cents. My problem occured after I installed a new antenna and was tuning the usr segs. I believe some quick button pushing on my part caused bad readings to be stored. I thought to clear only that segment but decided it was time to freshen up. In any event it was a simple and fairly quick procedure. I am an early user ca. 1999 and have had minimal to no problems. My output has not deviated from my earliest outputs using the orginal tubes. For an amp of this complexity I think its performance has been outstanding and Acom support has been better than that. As I approach my fifth year of use I think I made the right decision!

1035. Heat ducting?

Yahoo group: acom-list (1999 — 2009)
Date: 2003-09-25 19:45:04 UTC
From: Barry
Topic: 1035 Message: 1035

I wonder if anyone has used any kind of ducting on the Acom 2000A exhaust to direct the hear out of the shack? If so, I'd like to hear details.

I'm planning on operating the CQWW RTTY SO2R this weekend, and it's probably gonna get pretty warm in the shack with 2 amps going!
Tnx,
Barry--

From: RCARIELLO
Topic: 1035 Message: 1036

Barry,
I have a home made heat duct for my Acom 2000a.
The concern was limiting the air flow across the amplifier tubes.
I have not seen any increase in tube temperature.

I made a hood to cover both tubes air flow outlets from a tin Holiday cookie container. The box is 10x7x3 inches which covers both tube air outlets. Over the tube outlets in the cookie tin I made a 4 inch diameter hole. A 90 degree heating air duct elbow is placed into this hole. It is held in place to the hood with a large stainless steel hose strap. At the other end I fashioned a faxable four inch diameter aluminum heat duct pipe. This runs through my basement finished area wall to an unfinished part of the basement venting the hot air. The distance is less then two feet.

If I had to make the heat duct pipe longer I would consider adding a fan along the lengths of the pipe. I have seen fans designed for this purpose at Home Depot. Before doing this I would first try it without the fan and look for a change in tube temperature.

Best of luck,

Rich AA2MF

Barry,

One of the nice features 2000A is how it is totally controlled by the RCU. I made a 30 or 40ft extension cable for the RCU and put the Amp in another room (basement in my case). This may not be the solution for you but it has worked great here for a couple of years.

1040. arc fault/diode fix..??

Yahoo group: acom-list (1999 — 2009)
Date: 2003-10-05 22:40:41 UTC
From: exhper
Topic: 1040 Message: 1040

Someone a while back mentioned that ACOM had made a mfg. change to the 2000A's that involved a diode change. I believe that it was related to helping fix the intermittent arc fault error's. Can anyone provide any specific info. as to what exact diode was changed, pca location, is it user installable, etc.

Yes I am aware....:)...that arc faults indicate some problem in the antenna/feedline. I believe, and we know what that means, that my system is up to snuff. Those occasional arc faults do get annoying...:)

Any information would be appreciated.

thanks...

Don/N0FGK

1041. 2000A alarm - help

Hello to everyACOMbody!

I am planning to buy the Acom 1000 HF+6 linear amplifier;
http://www.eham.net/reviews/detail/1694 looks very good and reliable.

On the site http://www.harvest.com/acom1000.htm I can't see any ALC-control.

Who has such a linear and knows more about it?

What happens if I - by accident - use 200 Watts input with my Mark V?

Thanks!

Hans, I am using an Acom 1000 here. You are correct, there is no ALC. The amp will indicate if you are over-driving and will shut down if you exceed the input power excessively.

My radio is an FT1kMP and when using the amp I set the power limit to 50W. This is good for SSB but not quite enough to obtain full output from the amp on CW.

I have used the amp with a MK5 and then set the power limit to 75W. This works well for both CW and SSB.

It is very quiet and reliable. An excellent product. Chris G3SJJ

Hans,

I've had my Acom1000 since June and have used it in several contests and hauled it to Africa (3DA0) and back. It's performed flawlessly on 6M through 160m. It's an excellent amp, which I wouldn't hesitate to recommend. Of course I'm biased, I also own an Acom2000A as well.

Cheers,
Neil

Hello Chris,

Many thanks for you interesting reply on my question. This makes me feel very confident about the ACOM 1000!

I am planning to set my Mark V on Class-A with reduced power. This will give very good results, without exceeding the power input too much.

Thanks again and all the best!

From: IK0YVV
Topic: 1047 Message: 1047

Hi Guys,
This afternoon during the cw-eu sprint my acom2000 started to fail giving me this message : Heater Voltage too low : 9.83 V . Of course i tried several times to restart the unit but 90% of the times the failure happens again and when the countdown were able to finish after few second the unit failed again. This problem started to happen 5 days ago , but after a failure i had only to push it on and all went ok .This time the unit is out of work .I 've read something about bad connectors , have somebody has already had this kind of problem (HV too low : 9.8 v) , the main Voltage is ok so it's something wrong in the PA.Can anybody suggest me something ? Even if the unit is still in warranty i need it for the upcoming CQWW SSB and so i would like not to send it back to factory .
Thanks in advance .

It sounds like you have one of the units with the "old" low voltage connectors. I went through the very same problem with my 2000A, and Acom explained to me that they had been experiencing widespread failures just as you described with their low voltage connectors. They did change vendors as soon as the problem became apparent, but of course a number of rigs were produced with the faulty connectors in the meantime. I don't have the complete list which connectors in the rig are part of the low voltage circuitry, but I'm certain that if you look very carefully throughout your rig you will find one which has discoloration on it. And when you do check, don't forget to look under the tube deck. I distinctly remember that one of the low voltage connectors is in there.

The solution that was given to me was simply to cut off the connectors and hard-wire the connections instead. I did, and it has worked fine ever since. But do be careful not to cross any wires when you do this. I did, and it was a bear finding my mistake!

Marco,

It could be the connectors for filament voltage.

Open the unit and look at the PC board connectors on the lower PCB
located on the front right side. You may need a dental mirror to do
so. The failed connectors will be readily seen because of
discoloration. The jack is labeled J2. It is a four pin connector
next to a 12 pin connector. The board is called the low voltage
supply board.

You can make temporary repairs by soldering the wires to the bottom of
the PC board or directly to the pins. This operation requires moving
the small transformer out of the way.

Good luck.

1050. Heater voltage too low ..... bad connector ... of course

Yahoo group: acom-list (1999 — 2009)
Date: 2003-10-12 11:48:28 UTC
From: IK0YVV
Topic: 1050 Message: 1050

Hi Guys,
Thanks to very fast suggestions by Bruce , N6NT , and Brian , K3KO, the problems has been found and fixed . The connector on the lower PCB were completly burnt (even if it seems to be the second series orange connectors) . I've soldered the wires directly to the pins , i've checked also the connectors under the tube deck but it seem ok even it belongs to the first serie (white colored) . I leave it as it was . Now all seems to rum ok .
The acom now seems to work right , i've tried some long TX period on RTTY to let the temp of the whole pa warmer , but nothing happens , so the problem should be fixed . My acom has 4871 hrs and some more then 100k qsos , as Brian just 2 faults in 3 and half years : i had to replace a bad tube last year and now this burnt connector . I think is not too much for a contest PA wich had used in his life every travel mode : flight , boat , train , car ... without living his operator .... I 'd like to thanks again Bruce and Brian for their very fast suggestions.
Catch you soon on the air.

1051. Acom 1000/omni VI Pls

Yahoo group: acom-list (1999 — 2009)
Date: 2003-10-12 14:00:27 UTC
From: Jorge a Mejia
Topic: 1051 Message: 1051

When I use the omni VI Pls with the Acom 1000 trough the tx en tx out.
conection, I constantly get the Hot switching warning message on the amp screen. This happens on ssb , mostly when on vox mode, (slow mode) and occasionally when on ptt as well. Sometimes when I use the omni vi internal relay to key the amp it happens as well. My Acom works without any problems with Icom and yaesu radios though . Has anyone faced this situation

Dear Marco, IK0YVV,

I suggest you to throw out all three connectors and simply solder the wires.I obtained first ACOM2000A in Feb.1998, which is used by my son Andy ly2ta/ly7z.The connectors problem occured only before WPX 2002 CW.But the second, which I obtained in summer 1999 spoiled me two contests, as two connectors were burnt during different contests.Now there are no connectors in heating circuits of both amplifiers.
But: Prima di dire o di fare una cosa e bene pensare un po.

Hi Jurgis,
Thanks for suggetion ,i've noticed that even the other connector may burnt in the future , i've already fixed the wires directly to the pins in this too . I've leaved the other connectors as they are since its seem me to be in good conditions , but i think next time i'll open the acom i'll follow you and fix all the wires directly to the pins in the heating circuits. Warmest regards to your son Andy , i've seen his photo in the hospital ..... i hope he'll be back soon in good shape.
Best 73s and catch u sn Jurgis !
IK0YVV
Marco
P.S. The ACOM failed yestrday during our 40m sprint qso ... you have been the very last qso for that connectors HI HI !

1055. 2000A dead - and solution

Yahoo group: acom-list (1999 — 2009)
Date: 2003-10-13 15:45:26 UTC
From: Bob Naumann - N5NJ
Topic: 1055 Message: 1055

My Acom 2000A has been to Antigua 3 times, and also is used at the AA5NT multi-2 station most of the time. I've used it at home, but my neighbors don't care to "know" when I'm on the air, so I am hardly ever on the air from home, certainly not running the Acom.

Anyway, I had the heater connector problem with it about a year ago, and sent it back to be repaired. After the repair, we used it at AA5NT in the ARRL SSB and it worked flawlessly.

Just prior to the IARU in July, I went to AA5NT to make sure that everything was working well, and I powered up the amplifier. Everything looked normal, as it went into the normal countdown. I went outside to connect the coaxes to the antennas (everything is disconnected when the station is not being used due to lightning) and when I returned, the control was emtting a constant tone, and the display was showing nothing that made any sense.

I turned it off, and tried to restart it, but it only emitted the constant tone, and nothing was on the display at all at this point.

I contacted Will at Acom, and he suggested that it would be a problem with the remote control and the connections at either end. I checked that and verified that I had continuity end to end. Still did not work.

I called Will again, and he then suggested taking the remote control apart, removing the socketed chips, and re-seating them. I did so, and re-assembled the remote, connected it to the amplifier, and now it works!!

Any of us who had TS-940's understands the "chips in sockets" problem.

Just wanted to pass this along, in case you see the same problem with your amplifier, and to share my happiness with not having to ship it again!

Thanks Will !!

73,
Bob N5NJ

From: Barry
Topic: 1056 Message: 1056

Hi all,
I know I've brought this up before, but there have been many new members of the list in the last few months...

I'm having problems with Acom Tools on my XP computer. In the past, the pre-xmit band switching worked fine, though the software power meter didn't work. This past weekend, it didn't work at all. On my Win98 system, no problems at all.

Has anyone who initially had problems with XP figured out how to fix it?

Also, Gerry, W1VE, any update on your software?

Tnx,
Barry W2UP--

Hi Barry et al;

I use W2K and WinXP, using the current release of the SW, and
it works just fine -- this is not to say you do not have issues.

My Acom is @ K1IR at the moment, and I'll be there for SS CW, so
I wont be able to do anything about anything until after next weekend.
I believe the issues with XP are releated to the custom installer Michael had
developed for the Acom Tools version he developed.

Since my available time for ham radio software is very limited. I am working
with Michael's software, and adding support for some other radio programs
(right now, the TS2K control software).

After SSCW, I'm going to write a robust installer for Michael's stuff, which
should clear up the issues you are seeing.

Brian,
As a CW op, I find it useful, especially on the second radio. If I'm running on radio 1, and need to time jumping on a packet spot in between QSOs, I like to be ready to go, without having to send an extra dit. Also, it nice having the amp power display right on the screen in front of me, rather than having to glance off to the side.

Unfortunately, the current tool kit doesn't integrate with a SO2R station that has two amplifiers.

My experience is that it takes the better part of "Kilowatt Three North America" for the amp to make a band change, so only the
last few syllables actually make it on the air. However, we are truly gilding the lily here. While it would be nice for WL to be
able to instruct each amp to make the appropriate band change (and land in the right band segment) before the first transmission is
made... this probably isn't the main impediment to improving my contest score <grin>.

1060. 2000A - FT1000MP cw contesting

Yahoo group: acom-list (1999 — 2009)
Date: 2003-10-29 18:42:30 UTC
From: N1EU
Topic: 1060 Message: 1060

In the past I've noticed some issues when doing a lot of running in 48 hour cw contests with the 2000A vaccuum relay when keying the FT-1000MP in qsk mode.

I suspect these 2000A relay problems are due in part to issues with the relative timing of the MP's rf output and amp control signals, and perhaps these problems would go away if I used PTT instead of qsk.

I was curious if other 2000A - FT1000MP contesters who do a lot of cw running are keying via qsk or PTT?

Thanks & 73,
Barry N1EU

via qsk using the inhibit function of mp. The key out line doesn't
let MP produce RFp unless amp is ready.

What kind of issues are you seeing?

The skematic is here somewhere on the site.

What I do wonder is what the lifetime of the relay is. Mine has
almost 5000 hours on it.

I gave up QSK years ago..too many cycles of the vacuum relays even if the
timing is perfect, for my comfort level.
No relay problems with the 2000A and FT1000MP mkV so far.

I was specifically wondering if anyone is doing 20+ hours of qsk running in a 48 hour cw contest - this seems to be the worst case scenario for causing timing issues with the 2000A vaccuum relay such as the warning message "relay open, should be closed", etc.

Again, the ONLY thing I was asking is whether any serious cw folks are exercising a 2000A - FT1000MP combo a la' running qsk cw 20+ hours during a 48 hour cw contest or perhaps they're using PTT in that scenario. Wondering if I should switch to PTT, and starting to think so . . .

1068. Interfacing TS950SDX and 2000A

Yahoo group: acom-list (1999 — 2009)
Date: 2003-11-25 13:31:17 UTC
From: N1EU
Topic: 1068 Message: 1068

I'd appreciate it if someone would post the wiring scheme to run a TS950SDX in qsk with the 2000A. Also if you happen to know, would the wiring be the same for the TS930?

Thanks & 73,
Barry N1EU

I use pin 7 on the remote jack to turn on a power mosfet. Use a 10k resistor in series with keying line and gate. Use a 100k resistor from the gate to ground. The moset keys the 2000a. Been using the same setup with 930, 940 and other amps such as Alpha 87.

1073. 2000a faults

Yahoo group: acom-list (1999 — 2009)
Date: 2003-12-01 18:12:16 UTC
From: putt_1
Topic: 1073 Message: 1073

Folks,

I had a few problems with my 2000a this weekend, nothing spectacular but still a pain.

Tune and load went as expected on all bands but 20m.

As an example, if I was on 10m and QSY'd to 20m, I would switch antennas and tap the keyer for the amp to tune. On almost all occasion's, the amp would fault out and give me a LOW GAIN message then drop to Stand-Bye. Sometimes, the amp would cycle to OFF. There were two other messages that I saw over the course of the weekend but I saw them only one time a-piece. One was BAND SWITCH MALFUNCTION and the amp shut-off right away. The other was something about QSK KEYING MALFUNCTION and the amp shut-off. I was not using QSK.

What puzzled me further is that if the amp went to the stand-bye mode, I could get no output through the amp (pass through),, not even the 20 watts drive from the MV.

To recover, I would just move to another band, let the amp tune there and go back to 20m. Most of the time I could then get the amp to tune on 20m, if not, I did the main power off method (not on the control head).

Anyone see anything similar to this on their 2000a?

Thanks

Greg
K9IG

Without knowing more, I would say this is normal behavior! I had the same things happen to me during CQWW this past weekend, and in every case I could recognize the cause as something I did that would likely have done serious damage to the amp if it were not for the protection circuitry.

The most common place I see this stuff happen is when I go to 80m from one of the higher bands, and GM3POI has reported exactly the same thing with his 2000A. With a drive level near the limit for both the high band and for 80m, the amp will invariably fault if I don't first reduce the drive level a bit. At least in my setup, it takes the stepper motors a much longer time to tune when going to 80m than is the case with the other bands, and I think it is this protracted delay that causes the problem. If you just get in the habit of cutting back before going to 80 this will almost never happen, but you do then have to take a second to adjust the drive correctly once you do get to 80.

The other area where I shot myself in the foot a few times was in manual antenna switching. I use the Acom automatic antenna switch and it works flawlessly, but there are some bands where I have multiple antennas. There were a few cases where I was a little too quick in moving around among different antennas for the same band while the computer was still sending a message. The good news is that I was always able to get the amp working normally again after doing this--and if you think about it, that's very good news indeed. It says lots of good things about the protection circuitry.

I have seen all the messages K9IG mentioned, but don't pay a whole lot of attention to them unless the message is consistently reproducible. After all, the poor amp doesn't know that some lid reached up and hot-switched the antennas while it was performing its job flawlessly. It only knows what it saw on the output line, and there are so many variables involved here that

the protection logic could easily have come to the wrong conclusion about what happened to it.

There are some weird states the amp can enter that are a little terrifying when you first encounter them. Twice this weekend I got to a point where everything looked perfectly normal on the RCU, but the amp was providing no gain at all. This was always immediately following one of the funny faults. I just shut the amp down and brought it back up again, and then everything was normal.

Bruce, ZF2NT

Hi Paul. Seems like it was the original run of 2000a□s that had the filament connector problem. Haven□t heard of any issues since.

The new filament connectors has been used since sometime in Y2K, and
that solved the filament current problem for the 2000A.

I have just had one problem with my amp. My QSK relay was broken. I
found a new (surplus) on the web for 32USD.

Hello Everyone.

My cover on the Acom 2000 has been on and off many, many times. I have lost a ton of screws.
Does anyone know the size? Where to get some in the US? At this point I don't care if they are black or not.

Gerry,
?
They are metric (naturally) and as you may have noticed, the heads on them are very soft.
?
I got some from Acom a while ago, but I think you should be able to take one with you and match it at any good hardware store, or perhaps Home Depot or Lowe's.
?
Also, when installing them, be careful not to put too much downward pressure on them, or the chassis insert nut will pop out, and you cannot get them back in properly.

Good advice, Bob.

One of the chassis inserts on one of our Acom 2000s has popped,
and now the screw just turns and turns. Does anybody have any
ideas on how to get that screw out? For now, we a hoping that there
are no reasons to lift the lid on the amp, since we can't!

Dave,

It's not a heavy-duty screw. If there's any room under the head, you might be able to get a pair of cutters under and cut the head off. Put paper under the tool to protect the cover finish. Or use the cutters to pull the PEM nut up and hope you can create enough friction to keep the nut from turning and be able to unscrew the screw.

I used something like WELBOND which is a 2 part epoxy that bonds to
almost anything to hold the PEM nut back in the chassis

I used a tothpick to carefully lay a bead where the PEM nut met the
chassis

Hello,

Is de RF-power measurement of the Acom 1000 accurate ?
When i use an Acom 1000 , an antennatuner is not required for an antenna with a SWR below 1:3.I want to use the antennatuner Palstar AT1500CV between antenna and the Acom 1000. Is that possible ?
To connect the PTT of an Acom 1000 with the PTT of the Icom 756PRO2 is possible to connect it straight without relay ? Is that straight connection also poosible to an Yeasu FT1000D ?
My plan is to buy an Acom 1000 in the very near future so any suggestions ?

Thanks in advance,

73 , Hans , PA3HGT

Hans,

The Acom 1000 puts out a maximum of about 1250 watts. I think the tuner you are planning on using is capable of 1500 watts so it should not be a problem.

Also, you should be able to switch the amplifier with either the 756 ProII or the FT1000D.

I am using an "AmpKeyer" with my 756 ProII just for some added protection.

1089. RE: [acom-list] 2000A TECHNICAL SUPPLEMENT

Yahoo group: acom-list (1999 — 2009)
Date: 2003-12-21 15:20:46 UTC
From: N2TK
Topic: 1087 Message: 1089

What is the technical supplement?
What I have is a CD with the file ACOM2000ACD.zip ☐ 31.7M.There are several directories on this CD.
N2TK, Tony

1090. Re: Acom Tools and XP

Yahoo group: acom-list (1999 — 2009)
Date: 2003-12-22 01:31:28 UTC
From: N1EU
Topic: 1056 Message: 1090

I was wondering if there was any progress on getting Acom Tools working under WinXP? I know that a few folks report that it works on their WinXP pc, but it doesn't for many/most of us.

If Acom unfortunately isn't financially supporting the software development, I'm sure there are plenty of us who would be happy to pay a modest fee for it.

Hi Dennis,

I just uploaded the Acom Tools Help file to the Files section at http://groups.yahoo.com/group/acom-list/files/ so you can take a look. It allows the pc to control the 2000A (instead of the RCU) and provides a software link to Writelog so that the amp tuning will follow the radio automatically as well as antenna selection if you use the Acom 2000SW.

73 & see you in Stew Perry,

Hello,

I want to use the Acom 1000 with the Yaesu FT1000D.Can i connect the
Acom 1000 (key-in jack) with the FT1000D (TX-ground)without risks ?
The relay ,to key the Acom 1000, that is used in the FT1000D is
suitable for 500 mA/125 VAC,300 mA/220 VDC or 2 A/30 VDC.

Hans,

I connect my FT1000MP as described to both my Acom1000 and Acom2000 without any problems. I've connected the Acom1000 to a variety of other newer rigs as well such as an FT897 and IC756ProII - again no problem.

1098. Relay problem

Yahoo group: acom-list (1999 — 2009)
Date: 2004-01-24 12:45:56 UTC
From: Charles Fulp
Topic: 1098 Message: 1098

The QSK relay? in my ACOM 2000 apparently produces an error message.. relay
is closed when should be open.. on the
control box. The relays click and I can transmit fine, but when I open the
control line to receive, I get the error message. It sounds
like the relays go back to normal, and I can receive through the ACOM2000.
I can leave the amp off and transmit through it OK.
As soon as I transmit with the amp and go back to receive I get the error
message and have to push the OPR/STB button to transmit again.
This happens everytime even if no power is sent thru the amp..just cycling
the amp control input.

Is this a recognized failure mode?

Chas, I think it may indicate a failed vaccuum relay.
You might email Stan at Acom for the proper
troubleshooting steps to verify the problem.

I suggest you contact Acom for help.

It sounds to me like your relay contacts might me worn out, but not absolutely sure.

I have the schematic for the relay control plus some text info here if you need it. (e-mail la7dfa@...)

I have just replaced my QSK relay. Found new surplus ones for 32USD on the web.
Have been 'hotswitching' the relay for some years and it finally gave up.

Yesterday I made a mod on my FT-1000mp. I have mounted two phono/RCA connectors on the back of the radio (I hate 'DIN's'), and now use a pair of phono leads straight from the amp to the radio. It includes TX-gnd (without FT-1000mp relay delay time) and TX-inhibit to prevent 'hot-switching' of the QSK relay.

Chas,

The Kilovac HC-1 at N3RS failed early, and we simply replaced it with
a new Jennings RJ1A. The relay is accessible, and the changeout
took an hour.

Jim

You are right.

DIN connectors are pure crap. We deserve better.

They can be worked with by clamping the pin plastic in a vice and using binocular maginfiers. After that, I wrap tape around outside of the pin circle to prevent shorting to the metal case. A piece of spaghetti tubing on shield wires helps too.

The plastic has a nasty habit of melting when you heat the pin too much. It is possible to push the pins out of alignment because of this.

If you think standard DIN connectors are bad, try working on the 9 pin mini-dins that are showing up on radios now. The 13 pin full sized DIN's come in second place for worst.

To compound things, the numbering scheme for these connectors is often not obvious and doesn't always follow the usual rules or even common sense. If you are lucky enough to have a connector with pin numbers on it, they are usually only readable with a strong light and magnifier!

We need to form a lynch party to reward the inventor.

Humm ...does Acom provide the relays? are RJ1A easy to find.. ?
Would like to get moving on the repair.. Assumed I could replace a relay at least.. and had heard of failures, the mode didnt
sound familiar..as it appears to work..just not fast enough or something.

Jim

You are right.

DIN connectors are pure crap. We deserve better.

They can be worked with by clamping the pin plastic in a vice and
using binocular maginfiers. After that, I wrap tape around outside of
the pin circle to prevent shorting to the metal case. A piece of
spaghetti tubing on shield wires helps too.

The plastic has a nasty habit of melting when you heat the pin too
much. It is possible to push the pins out of alignment because of
this.

If you think standard DIN connectors are bad, try working on the 9 pin
mini-dins that are showing up on radios now. The 13 pin full sized
DIN's come in second place for worst.

To compound things, the numbering scheme for these connectors is often
not obvious and doesn't always follow the usual rules or even common
sense. If you are lucky enough to have a connector with pin numbers
on it, they are usually only readable with a strong light and
magnifier!

We need to form a lynch party to reward the inventor.

Is the RJ1A better than the HC1.
looks like a guy in GA sells them.. maybe should order a few.
what is the operating voltage for those things.?
Assume direct replacement..pin for pin?

Normally they are identical and they have identical datas.
There is a variant with a (white) silicone encapsulated ceramic
portion, but it is larger on the contact side and I would not use one
of those even if it is more quiet and has better datas.

If you can unscrew the coil, save it for later. You may get contact
sets cheaper than the complete assembly.

Be careful when soldering the coil contacts as they are very fragile !

I had a similar problem soon after my 2000A arrived a few years ago. The factory said the relay was sticking because they got a bad batch of HC-1 relays. I replaced the relay with a Jennings RJ1A because I had one on the shelf. The factory sent me complete instructions for the replacement. The only tricky part is making sure not to let solder wick into the braided leads. If you do, they will not flex enough, the relay sound will be conducted to the circuit board, and the relay noise will be louder. Later on, Acom sent me a Russian replacement relay and a small length of replacement braid. Fortunately, I haven't needed to use them (yet -- knock on wood.)

Note that I could find nothing wrong with the HC-1 relay after removing it from the 2000A. This problem has been reported by several others. I saw it happen at KC1XX during a contest. One 2000A owner replaced his relay several times before the amp stopped faulting. One of the failed relays was a Jennings.

I have long suspected that the 2000A has a design flaw in this area, but there's not enough evidence to be sure or even to speculate about the nature of the problem. It could be that there is a logic problem in the relay control/sensor system that eventually damages the relay. Such a problem might be intermittent, damaging the relay on a low probability basis. I have a sense that the problem results from QSK operation because I did a bunch of testing with QSK when I first got the amp, but don't use it much anymore.

BTW, I was using an FT-1000MP at the time of the failure. I was using the TX and TX ENH loop.

Yeah, what Dick said ;-)

Seriously, just want to voice agreement and my identical outcome with an MP running qsk.

Other point is that I don't think Max Gain sells the relays any more but it's worth giving Alan a call.

Hi Chas. They are pretty much interchangeable, pin for pin. Some say the Jennings works better at high speed. I have always used QSK with my amps ☐ Acom 2000a, and my 2 Alphas that I have had. Never had to change a vacuum relay. Was always careful to use the fastest signal out of the rig for keying the amp. Kenwood had a 12V transmit signal, Icom an 8V transmit signal. Don☐t know what Yaesu has available or how fast the signal is out of it. Used that to drive a power mosfet. This was always faster than any relay switched output from the rig.
Operating voltage is 26V.

Hello all,

I located a supplier of Kilovac HC-1 relays.

These are new pulls from equipment and they
look great. I ordered 2 and just received them.
Price is $25.00 Each !!!!!!!

order from www.american-milspec.com

73, Ted K2QMF

Ted,

I'd be interested in your experience with the replacement process.
Mine is getting old . I suppose it will last until the waranty runs
out.

1117. Re: [acom-list] HC-1 Relays for Acom 2000A

Yahoo group: acom-list (1999 — 2009)
Date: 2004-02-05 01:11:50 UTC
From: k2qmf@juno.com
Topic: 1115 Message: 1117

Hi Brian,

Actually, my Acom 2000A is working perfectly.
I ordered the relays because it seems that some
2000A users are starting to have problems with them.
I operate QSK CW so figure it is only a matter of time
till my relay starts to act up. Also, it seems that some
relay suppliers were running out of them...

1126. RE: [acom-list] FT-897 + CAT + Acom 1000 ?

Yahoo group: acom-list (1999 — 2009)
Date: 2004-03-04 07:30:24 UTC
From: Neil King
Topic: 1125 Message: 1126

Dave,

Yup, it can be done and it is relatively straightforward once you realize the manual is wrong.

The FT897 Errata states:

In this manual, the sections describing "Linear Amplifier Interfacing" (page 10) and "Rear Panel ACC Jack" (page 18) are incorrect. The correct descriptions are:

PAGE 10: LINEAR AMPLIFIER INTERFACING
The FT-897 provides the switching and drive-control lines required for easy interfacing to most all commonly-available amplifiers sold today. These include:
- The Antenna Jacks ("HF/50MHz" and "144/430MHz");
- A T/R control line (open circuit on RX, closure to ground on TX); and
- A negative-going ALC jack (control voltage range: 0V to -4V DC).
- When interfacing to the VL-1000 Solid State 1 KW Linear Amplifier, the optional CT-58 Interface Cable provides for easy interconnection (requires that the Menu Mode No-020 [CAT /LIN/TUN] setting be changed to "LINEAR").

The rear-panel CAT /LINEAR jack is an 8-pin, miniature DIN type, with the "TX GND" pin providing a closure to ground on transmit, for T/R control of your linear amplifier. The ACC jack is a miniature stereo type, with external ALC input capability on the tip connection. The main shaft is the ground return. The ring connection of the ACC jack, when closed to ground, places the FT-897 into the transmit mode, and sends a steady CW carrier, for amplifier (or antenna tuner) adjustment purposes.

Note that some amplifiers, particularly VHF or UHF "brick" amplifiers, offer two methods of T/R switching: application of +13V or a closure to ground.

Be sure to configure your amplifier so that it switches via a closure to ground, as provided by your FT-897's CAT/LINEAR jack ("TX GND" pin).

Alternatively, many of these amplifiers use "RF Sensing" to control their relays; if yours is in this category, you may then use the T/R control line from the "TX GND" pin of the CAT/LINEAR jack for control of your HF linear amplifier, and RF sensing for your VHF or UHF amplifier.

The "TX GND" T/R control line is a transistor "open collector" circuit, capable of handling positive amplifier relay coil voltages of up to +50V DC and current of up to 400 mA. If you plan on using multiple linear amplifiers for different bands, you must provide external band-switching of the "TX GND" relay control line from the CAT/LINEAR jack.

Dave, just remember that the 8 pin mini DIN's are a really fragile way of connecting anything to the back of the 897. Be very careful that everything is aligned properly before you push it in. The pins are so fragile that little effort is require to bend the daylights out of them. It darn near cost me the use of my Acom1000 in Africa last year, given that I didn't have a spare with me on the trip.

Hope this helps and good luck,
Neil

Dave

Page 10 of the manual tells you how to do it. The T/R (TX-GND) keying line comes from the ACC connector.

You may have to modify the CAT cable to do this, or Yaesu might have a special cable.

You would connect the Keying line from the Amp (any amp with low power contacts) to the TX-GND pin of the ACC connector. This contact can handle 50V at 400mA maximum.

Mike,

The manual is wrong. The CAT/Linear jack is used to provide TXGND, not the ACC jack. This requires fabricating an adapter or modifying the CT62 CAT cable to pull TXGND & GND off.

The Yaesu website contains a pdf file with the revision to the manual correcting page 10. If you can't find it, email me directly and I'll send it to you.

1130. New ACOM 1000 User

Yahoo group: acom-list (1999 — 2009)
Date: 2004-03-16 00:42:18 UTC
From: kb7our
Topic: 1130 Message: 1130

I am soon to be the proud owner of an ACOM 1000. After much reading this is the one I decided to purchase. I plan to use it with a IC-756P2 and standard 110V house current. Will at HFPOWER is truly a great guy to deal with. Absolutely top notch customer service. The amp should arrive this week. For hookup, my understanding is that I need a simple single RCA cable (besides the coax of course). Is this for the ALC or Send connection on the radio? Also, I assume the amp comes tapped for 240 and so I will have to tap for 110 house current. Any advice on connecting this amp would be appreciated -- this is my first amp and so I don't want to blow it up doing something stupid. Of course I don't want to kill the radio either. Thanks for helping a new QRO guy keep safe.

Wade

The cable is for keying the amp from your transceiver. I don't know what kind of keying the 756 pro II has for an amp. I run mine with an Orion and I need 2 cables for keying with full QSK. One cable comes from the radio that comes on when the radio is keyed. Another cable comes from the amp back to the radio that tells the radio the amp antenna realy is now transferred and then allows the radio to actually transmit.

All modern transceivers have ALC built into them so amps don't require an alc line with modern transceivers. I run my acom 1000 on 240 volts. That is the way it will come from the factory. All you have to do is rewire the power plug for 120 volt operation. I don't know how well the amp will run on 120 volts as you will be drawing at least 12 amps on your house wiring. This may cause the 120 volts to drop some. You will probably be fine if you restrict your output power to around 800 to 900 watts instead of 1000 to 1200. No one will be able to tell the difference.

Hello Wade,

Congrats with your new Acom 1000 and the pro2.
Here is too guide you to connect the Acom 1000 :

http://www.qsl.net/kk5dr/IcomKeyInterface.html

and

www.qsl.net/pa3hgt/ look for "techshit" button and look for the
schematic diagram to connect Acom 1000<>IC756PROII

The difference is that you can connect to acc 1 or acc 2 port.
It's ur choice.
Succes.

Just another reiteration of my plea to the cosmos to come out with a version of Acom Tools for the 2000A that consistently works under WinXP.

Thanks to everyone for the wonderful support to get me started with my new amp. It arrived today, but did not include an ac plug. The manual says the dealer is to provide that wired for my situation. I got mine from Will (great guy) at HFPOWER. Does anyone know if I should have received a power receptacle or do I need to make a trip to Home Depot for either a 240 or 120 plug? I may deal with 120 at lower power (500W) until I have a chance to wire for 240 in the shack. At minimum I have to power this baby up to see the neat display :-)

Thanks again to all! Great group.

Wade

I had to supply my own.

Anyway, it would likely cost them more to ship it to you then for you to go pick on up at HD.

Get a good quality one. This is not the time to be cheap.

1139. New Acom 2000A user

Yahoo group: acom-list (1999 — 2009)
Date: 2004-03-23 12:57:26 UTC
From: vk3ajj
Topic: 1139 Message: 1139

Hello All,

I have just purchased a used Acom 2000A and just got it operational tonight. All looks to be well.

I am hoping to use this amp in a remote station installation and would be interested in hearing from others that may be doing this.

I have downloaded the Acom tools Windows program and have the following immediate questions:

1 In the manual it indicates that the cable for connecting from the serial port to the amp is not a standard serial cable. Can someone advise me what is the pin configuration for the required cable.

2 I am using the Windows XP operating system at the remote end - assume this does not present a problem?

3 The functionality that I am most interested in is being able to turn the amp on and off remotely. Would be interested in any helpful info from anyone who is doing this.

Any other tricks and pitfalls regarding the use of this software for amp computer control is of course appreciated.

Cheers and thanks

Paul (vk3ajj)

I'm at work now, so this from memory, and it's been a few years since
I did the hookup. Suggest you get another confirmation before
proceeding. As I recall, you just want RXD, TXD and GND. Others left
unconnected.

> 2 I am using the Windows XP operating system at the remote end -
> assume this does not present a problem?

It may be a problem. The software works like a charm on my Win98
computer. On my XP computer it doesn't work. Some with XP systems
tell me it does work, but not mine. Acom has promised an update for
several years, but nothing has been done. Very disappointing!

Someone in 5-land did this. I don't recall who. Hopefully, he'll
contact you. If not, you might want to check the list archives via
the web: www.yahoogroups.com

Yahoo group: acom-list (1999 — 2009)
Date: 2004-03-23 17:30:34 UTC
From: kb7our
Topic: 1130 Message: 1141

I purchased my own heavy duty right angle AC plug and wired the amp for 120V. It makes sense that the dealer would not provide this, due to the possible different end user requirements. Setup involved re-tapping both LV and HV transformer windings (LV via jumper, HV via taps) and replacing the 2 10A fuses with 20A ones. Since I only have 120V and 15A in the shack/office, this is the route I took until I can get 240V wired in. Several smoke tests at ~500W (20-25W drive) have gone well so far. Reports I've received on SSB are excellent. Don't want to key up full power and risk tripping the room circuit, which is 15A, but when the 240V line comes in it will be time for full smoke stress testing. With some basic playing, considering my working conditions, I am very pleased with this AMP and it has met my expectations. Customer service from Will exceeded them.

1143. Using Acom Tools to switch on the Amp

Yahoo group: acom-list (1999 — 2009)
Date: 2004-03-27 10:42:04 UTC
From: vk3ajj
Topic: 1143 Message: 1143

Hello,

I have just got Acom tools operational with my Acom 2000A.
A couple of questions:

In the help file it mentions that additional hardware is required if the software is to be used to switch on the amp. Does anyone have any idea what this hardware is and where same can be purchased?

I note on this discussion group that users have reported problems using Acom Tools with Windows XP. It seems to be doing all it should on my Windows XP set-up at presnet. Are these reported problems of an intermittent nature or am I just lucky???

Any feedback is appreciated

Thanks

Paul (vk3ajj)

Acom Tools worked for me on my old Win98 pc but has never worked on my WinXP computer. Acom seems uninterested in fixing the software (why?). Perhaps some day we'll see an independent & improved shareware version of AcomTools.

I'd like to get the second fan for my 1000 just to have it on hand should I ever have a use for it with future operations. Does anyone know of an equivalent to the ACOM offering or would I be better off to just go with the "plug & play" factory fan? Any idea what it costs?

Can☐t help you on the equivalent fan. But, when I got my new 2000A a few years back, I added the external fan right away. I sandwiched some furnace filter material between the external fan and an outside cover for the fan. I change the filter once a year. It is dirty at that point. The inside of the amp has no dust or dirt. It has stayed nice and clean.
By the way, I have my amp in the basement mounted about 7☐ off the floor on a platform next to where all the coax comes into the house. On my desk I just have the RCU.

Hi Wade / Group

A more sensible response I hope.....to the previous one.....

In the UK I obtained the extra fan from an electrical wholesaler who I have an account with (Farnell/CPC). The fan is made by Papst and the hole fixings were an exact spacing to the holes in the Acom chassis. In fact after I sourced this Papst fan, the UK Acom supplier contacted me to determine where he could obtain them himself to supply to customers.

I still find the Acom 1000 is quiet in use, even with the extra fan.

Hope that may be of some help.

Phil,

Perhaps I should have explained that in my actual experience with the Acom 1000, in 48 hour DX contests, running maximum output power from a hot, humid DX location the Acom 1000 needed no additional cooling.

This fact causes me to question the need for a new (<1 month) user to think they need to add anything to the amplifier.

N5NJ,

I want to be able to run the amp full bore non-stop for a year from my garage in the AZ desert, where ambient temps can exceed 120 deg in the shade. I figured this is why the amp is built to accomodate the extra fan and that I needed one "just in case" it got a little warm on top near the exaust port where I keep my coffee cup. And you know what boiled coffee tastes like. ;-)

Topic: 1153 Message: 1153

Hi Wade

The extra fan I used is the Papst "Slimline AC Fan" dimensions 25mm deep and 92mm square.The mesh filter originally fitted to the Acom 1000 case fits on the outboard side of the fan and the fan fits on the outside of the Acom 1000 case.

There are 2 models in each voltage range: (I fitted the quieter of the 230v fans, slightly lower throughput but more than enough):

115v @5w = 27 dBA noise level
115v @9w = 40 dBA

230v @6w = 24 dBA (Model fitted to my unit)
230v @11w = 35 dBA

When I checked my Acom 1000 the rear of the mesh cover was covered in a thick layer of dirt - I haven't been around the back for about a year. So I got the half inch paint brush out and gave it a clean down. It must have been restricting air flow by 50%, so that is worth mentioning.

1154. Acom 1000 second fan - amended info!

Yahoo group: acom-list (1999 — 2009)
Date: 2004-04-17 19:08:12 UTC
From: Phil Catterall G4OBK
Topic: 1154 Message: 1154

Hi All

I've checked this out fully now and the extra fan is not an AC Mains fan - it is 24v DC. There is a pickup for the lead on an adjacent PCB at the rear of the case. It was worth removing it to check the part number and clean out the area around the fan.

The type I fitted is the Papst 24V DC 96 mA unit (2.3w). The Part Number on the fan case is Papst Type 3414N.

I believe this is probably known as the Papst 3400N Megafan. The 32 dBA version is ?14 UKP the 36 dBA one is ?12 UKP.

I recall having to source my own long bolts and having to remove the mains transformer to gain access when it was orignally fitted.

1155. New ACOM2000 "prot" light mystery error

Yahoo group: acom-list (1999 — 2009)
Date: 2004-05-10 11:02:34 UTC
From: lfe73
Topic: 1155 Message: 1155

Does anyone have an idea idea what might be causing my ACOM-2000 protect light to come on and kick the amp into standby? Its happened a lot the past couple days especially when using SSB.

There are NO other indications or messages that come on the screen. Tonight when talking to Tom DF2BO (Optibeam Owner and manufacturer) on 20 meters (14.207) the amp tripped back to "stby" about 10 times. I was using 44 watts drive...swr was solid at 1.0:1!!...line voltage as measured on the control head was 242V etc etc etc.

There is absolutely NO reason this should happen. It happens in the middle of a sentence and not when initially keying up the rig to talk.
I thought it might be a keying sequence error between the Ten-Tec ORION and amp but when it happened numerous times in mid sentence I knew that was out!

Whats going on?

Larry,

what kind of PTT keying do you use between ORION and ACOM? I had the same problem when using only the PTT line, using PTT In / and PTT OUT on the ACOM (Key In / Key OUT) solved this problem for me!

Hi Larry,

Just what error does the RCU display? Can you scroll back through the last N faults and see if there is a common thread?

One possibility (generally shows up as arc fault) is something intermittent in the feedline path from the amp out put to antenna.

1500 watts out is a good tool for shaking down weaknesses in this path. It is a bit frustrating with the ACOM though. Nothing gets charred to help identify the fault!

http://www.difona.de/pdf/acom1010.pdf for more details.

1200 VA transformer in the Acom 1010 instead of 2000 VA in the Acom 1000.

I think the 1010 is made for the German and others markets where maximum 700 Watt power output is legal.

Hi,

I saw New ACOM PA "1010" in Dayton.
Looks like this is just pretest version.
The main problem of 1010 is twisted body with a heavy staff inside
and very cheap Pi-coil wire. ACOM needs to modify it ASAP.

From: Massimo Taddei
Topic: 1161 Message: 1161

hi guys,
I've got a problem with my ACOM 2000A: when I try to auto tune , it appears those messages: the first one is "AUTOTUNE COMPLETED PLEASE REMOVE DRIVE" and a few second later this one "DAFAULT: CHECK VSWR PLEASE REMOVE DRIVE".I followed all the indications of the manual. the antenna (hy gain th11) VSWR is ok, the cable which connect the transceiver to the amp is ok too. I also tried to connect it with a dummy load (bird) and I tried to use three different connection cables (tx-amp), but I still have the same problems, what's more sometimes it doesn't change the band, but I've to say that in default mode the amplifier works, the out power is ok. I tried to erase many times the USER MEMORY but the problem still remains. can anyone help me?

Date: 2004-06-12 23:06:08 UTC
From: k2qmf@juno.com
Topic: 1164 Message: 1164

Hello All,

I have a strange problem with my 2000A.
I am setting up my new M/S contest station
and find that when I QSY from 20 Meters
to 40 Meters I get a red PROT light and the display
says High SWR 650 Watts. This does not happen when
I go from 80 to 40 !!!! Very strange... My antennas have very low
SWR and I even replaced the 40 meter antenna with a dummy
load and it still happens. I have band reject stubs on all the antennas.
When I remove the stubs on the 40 meter antenna the problem
goes away! The the amp changes from 20 to 40 with no problem.
I have double checked the stubs and they are fine...

Any help or suggestions would be very much appreciated.

Thanks in advance and 73, Ted K2QMF

1170. 2000A Dead

Yahoo group: acom-list (1999 — 2009)
Date: 2004-06-23 12:56:55 UTC
From: Bruce Marton
Topic: 1170 Message: 1170

My Acom 2000A developed a strange error. At the end of the 2+min. warm up, instead of setting up to run, it faults out with an error listed as "screen voltage on before time out complete". I restarted the process a second time and it came alive. The next night it did the same thing, I had to reset the start up several times to get it to operate (which it does just fine after) and now it won't start at all. I was unable to reach Acom over the past 10 days and had no reply to my voice and e mail messages, but was able to reach Krassy last night on his phone. He said it appears I may have a bad board inside and to bring it in. Has anyone else seen this fault? If so, what was the cause?

I had a similar problem, although not exactly the same.

Will suggested that the chip inside the control head might not be seated in it's socket properly. It looked fine, but after removing and re-inserting it, the amp has worked fine ever since.

Thanks for the heads up Bob, I'll forward this on to Krassy. He told me he had not heard of this problem before, so if this is the issue, it will be an easy fix. Too bad I didn't hear about it earlier, I reset the control head, which erased all my memories. Maybe a little DeOxit will do the job..

I had a similar problem, although not exactly the same.

Will suggested that the chip inside the control head might not be seated in it's socket properly. It looked fine, but after removing and re-inserting it, the amp has worked fine ever since.

Subject: [acom-list] 2000A Dead

My Acom 2000A developed a strange error. At the end of the 2+min. warm up, instead of setting up to run, it faults out with an error listed as "screen voltage on before time out complete". I restarted the process a second time and it came alive. The next night it did the same thing, I had to reset the start up several times to get it to operate (which it does just fine after) and now it won't start at all. I was unable to reach Acom over the past 10 days and had no reply to my voice and e mail messages, but was able to reach Krassy last night on his phone. He said it appears I may have a bad board inside and to bring it in. Has anyone else seen this fault? If so, what was the cause?

Re-seating the chip erases all the memories too.

Krassy knows about it. It's something that we can do without sending the amp to Acom so it's worth a try.

1175. Re: [acom-list] bad subscriber address

Yahoo group: acom-list (1999 — 2009)
Date: 2004-06-23 16:45:27 UTC
From: Barry
Topic: 1173 Message: 1175

Bob,
Here's how the list works on bounces:
If messages sent to a member are consistently returned to Yahoo!
Groups with an error, that member is considered "bouncing." Their
Yahoo! Groups account is deactivated, and group messages will not be
delivered to the account.
Once an account is considered bouncing, Yahoo! Groups will send a
series of test messages to the member. If the test messages are
returned as undeliverable, then the account will continue to bounce.
However, if a message is delivered and not returned as undeliverable
within five days after it was sent, the account will automatically be
reactivated. Members may also manually reactivate their accounts by
visiting their My Groups page.

Currently, there are about 20 accounts deactivated because of
bounces. The account you mentioned is still active, so it's not a
consistent bounce. Every ISP burps occasionally, so I don't want to
dump anyone because of a temporary glitch.

Barry,

I moderate several Yahoo groups so I know how this works.

If the address is sending rejects to the sender (in this case me) and not to the group address, yahoo will never automatically do any of what you describe.

I suspect you will now get one of those messages, and I'll get another one from this message from that address.

I think it might be appropriate to just go ahead and delete this one.

73,

Bob N5NJ

1178. Acom 2000A up and running

Yahoo group: acom-list (1999 — 2009)
Date: 2004-07-05 14:19:05 UTC
From: Bruce Marton
Topic: 1178 Message: 1178

OK, I wanted to post what Krassy did to solve the mystery "screen voltage is on before timeout complete" error. He had suspected a possible tube issue; however he first tested the screen voltage regulator transistor. The transistor proved to be in fine working order, so Krassy replaced the tubes with a new matched set. The amp fired right up without a hiccup. He ran a diagnostic on the screen current which appeared to be in order; however he wanted to burn in the tubes for a period of time before doing any final check.

Wouldn't you know it, just as we started the burn in, the area in Medfield was hit by a lightening strike and the power went out! That was that. So I packed up the amp and returned to Maine. I set it up at home, started to use it and it appeared the tubes were not matched, with one doing most of the work. I called Krassy, he said don't worry; I'll come up to you on Sunday, July 4th! What a guy. We spent most of the day enjoying antenna work and amp alignment. As it turned out, the matched set that was installed at the Acom office appears to have been mismatched by someone when they were packaged in the boxes, probably at the factory. So we measured the parameters of each tube, recorded the data and swapped the tubes until we got the best pair. The tubes were then burned in for several hours and we aligned the current settings. Man is this amp performing! 70 watts drive, without overdrive faulting and it was developing 2.5Kw. The temps between the tubes were dead nuts equal.

This is customer service, it doesn't get any better. Krassy hung out for dinner at our house and we worked 75/20/17 meter phone and some CW. He then headed home and we did a sched at 10:30pm to compare his 3 element 75 meter beam vs. my 110 foot elevated GP at the ocean. We worked into Europe and South America with very high band noise levels (S9 plus 5). As it turns out, I'll be doing a 3 element wire beam for the low bands, he handed me my head into Europe. I beat him into South America, but that was off the side of his beam and expected; not to mention I was using the 2000A and he was operating 100 watts barefoot.

I cannot say anything about Acom other than this is top notch service! Thanks Krassy and good luck down at P40HQ this week.

1183. Remote swtich ON/OFF

Yahoo group: acom-list (1999 — 2009)
Date: 2004-07-11 09:28:46 UTC
From: Natale Borghetti
Topic: 1183 Message: 1183

Hi Group,

Just bought a new Acom2000A to be used at my remote station, I read all the documents and message related to the remote switch ON/OFF I am little bet confused.

Could any one confirmed the following:

The DB9 adapter has to be inserted on the back of the PA where nornally the RCU is connected.

The optoisolator has to be connected to the Contact nr. 1 and nr. 5 of the adapter.

Therefore when you use the amplifier in remote the RCU has not to be connected and all the commands has to be sended by CAT with the software.

When the amplifier has not to be used on remote, I have to simple disconnect the DB9 adapter (that has the connected optoisolator), and connect the RCU.

It is that....all correct...????or I completely misunderstanding the system ???????

I would appreciate any help

I already own the Acom 1000 which is a real nice amp but at present I have
an 2000a here on loan. It is so sweet. I don't have the handbook so need
some info. How do I access the menu. I want to get to the swr reading.
Thanks Chris G3SJJ

1187. ACOM 1000 screen grid currents

Yahoo group: acom-list (1999 — 2009)
Date: 2004-07-18 16:52:24 UTC
From: dj3iw@t-online.de
Topic: 1187 Message: 1187

Hello all,

I am a new user of an ACOM 1000 amp and new to the list too.
Can the experienced users please tell me what screen current
their 1000 draws when tuned up with a steady carrier to the
800-1000 (maybe 1200) watts out levels?

1188. ACOM 1000 / Orion

Yahoo group: acom-list (1999 — 2009)
Date: 2004-07-19 22:01:34 UTC
From: John Rader
Topic: 1188 Message: 1188

New ACOM 1000 owner question.
What is the prefered tune-up method for the 1000 with an Orion? The Orion's tune output is automatically reduced to 20 watts, and can be increased to the set output by the push of a button. Should I tune with or without the amp's attenuator at, 20 watts, full power(+-60 watts), or some combination? How important is it to peak at full power?

Yahoo group: acom-list (1999 — 2009)
Date: 2004-07-19 22:34:06 UTC
From: Carl Moreschi
Topic: 1188 Message: 1189

I use my N4PY Orion control program (www.n4py.com) to control my Orion and Acom-1000. I use a feature called "Amp Tune". This feature remembers the drive level for the Orion to drive the Acom -1000 for each band. I set the Orion at its correct drive level for the band with this feature and then use the Acom-1000's attenator. I set the load control to center the tuning indicator and peak the amp's tune control for paek output and then turn the amp's attenutor off. I do not re-peak at full power.

Carl,
I would like to try your software. Does the same version work with
the K2?
John K5XTX

1191. 2000A Frequency program?

Yahoo group: acom-list (1999 — 2009)
Date: 2004-08-01 23:44:05 UTC
From: k2qmf@juno.com
Topic: 1191 Message: 1191

Hello All,

I am looking for a small program that would work with Acom Tools, much like
Writelog does. You would open a small window and type a frequency into the window and when you hit Enter the Acom 2000A would go to that frequency.

This would allow you to change frequencies without keying the amplifier.

Is there a program similar to this available or can someone write it??

Many Thanks in advance and 73, Ted K2QMF

Ted,
I spoke to Tom Dandrea N3EQF who sells the Log EQF logging program about doing a version that would interface with the Acom.
He said that if there was enough interest, he might be able to work his software around. Contact him and tell him you are interested, I asked him to do it and if he gets several calls, he might go for it.

From: Carl Moreschi
Topic: 1191 Message: 1194

I have radio control programs that work with most TenTec, Icom, and Kenwood radios. These programs will also work with all logging programs that support the tentec file interface (which is most logging programs). I dodn't realize the Acom 2000 had direct frequency entry. I have an Acom 1000 which of course is manual tune only. I will try to get a spec from Krassy so I can add support to my software for the Acom 2000. See my webpage at www.n4py.com.

1196. Acom 2000A Control?

Yahoo group: acom-list (1999 — 2009)
Date: 2004-08-12 15:01:54 UTC
From: k2qmf@juno.com
Topic: 1196 Message: 1196

Hello All,

I am not able to get the basic program "Acom.exe"
to control my 2000A. AcomTools works fine but
"Acom.exe" does nothing. I am not very computer
smart so it must be that I am doing something wrong.
Any help or suggestions would be very much appreciated.

73, Ted K2QMF

From: Hans , PA3HGT
Topic: 1197 Message: 1197

Hello All,

I own a Acom 1000 with a great joy but i have some qeustions about the service from Acom.
I did sent several emails to Acom and no reply ....
Are there any users with the same problem ?
I had some questions about a front panel of a Acom 1000 and no response!
Are there users of this nice product with the same experiences ?
Because ... when you've a serious problem ..... and you've the same experience then my .... you've a big problem !

NOT AT ALL !
Hello Hans,
in opposition, I got a notable good service with VERY pricise information about "how to do" for 3 times.
Make sure, You use the right e-mail address:

ACOM@...

that worke for me. I got all the information during hours.
Really a GREAT service !

From: Phil Catterall G4OBK
Topic: 1200 Message: 1200

Hi Hans,

I know that the servicing and repair work for Acom equipment sold by the UK Distributor for Acom is carried out in the UK. A friend of mine recently had to have a repair done under warranty, on his Acom 1000 after a component failure.
This work was speedily completed before the Acom was returned via carrier. I understand that in the UK, current trading standards law dictates in the frost instance that the retailer you purchased the equipment from is responsible for the after sales service of the product, should anything go wrong.

Good Luck,
Phil G4OBK

1201. External Cooling Fan for 2000A

Yahoo group: acom-list (1999 — 2009)
Date: 2004-08-21 19:40:46 UTC
From: Dave Hawes
Topic: 1201 Message: 1201

I have purchased from Acom the external supplemental cooling fan for the 2000A. It came with no mounting hardware, nor installation instructions.

To minimize down time, I would appreciate it if someone who has made this mod send me a short list of necessary hardware, plus wiring instructions. It can't be rocket science, but it would help to have some pointers from someone who has done this already.

Thanks in advance.

73 - Dave N3RD

1202. Re: [acom-list] External Cooling Fan for 2000A

Yahoo group: acom-list (1999 — 2009)
Date: 2004-08-21 21:00:45 UTC
From: David J. Strout - W2YC
Topic: 1201 Message: 1202

With the xfmer out and looking at the fan from inside the unit, there is a tiny pc board right to the left. It is marked for + and - and the fan connects there. Either solder leads from the fan of make up ur own connection as I have done. Fan mounts to rear with air inflowing. Hopes this helps, Dave

Hi Dave,

Also, you may want to consider adding a filter to the inlet of the external fan. I cut a square out of a furnace filter and attached it to the fan. I change the filter every year. So far it has kept the inside of the 2000a clean.
N2TK, Tony

1210. ACOM 2000a info needed.

Yahoo group: acom-list (1999 — 2009)
Date: 2004-08-31 23:20:39 UTC
From: jimgrunner
Topic: 1210 Message: 1210

I am wondering if ACOM is still in business. I have sent them email and called them directly with no response. It is possible that they are all on vacation now. I was looking for the price and availibility of the ACOM 2000a. I imagine that there is someone on this list who has recently bought this amp and can share this information.

tnx, 73
Jim, AD6WL

They're sometimes like that Jim. Probably not what you want if you have a critical question, but your experience has been shared by some of us. The good news is, when you do get a hold of them, they will go out of their way to take care of you.
GL&73,
Dan

Hello Jim,

I have this problem for month's !
I did sent several mail to several adresses :

will@...
info@...
acom@....bg
k6nd@...

and no reply!
I did sent a email several days ago and no reply again.
I am busy for month's to get a single reply from Acom
What i think that you can't treat (future) costumers like that.
For the rest i heard a rumor that Acom is in trouble ?
Maybe a few serious reviews about support on eham will help...
For myself i recommend Acom no more for my friends because i´ve
bad experiences about email contact with Acom.

Hi Carl,

I was wondering if you were able to get any
information in order to write a control program
for the Acom 2000A ???

Many Thanks in advance, 73, Ted K2QMF YCCC

I contacted the big boss at ACOM on this subject and below is the the answer
I received:
73
John, ON4UN

Hello John,

Please see the last message we sent to Hans:

Dear Mr. Pluijgers,

I have answered all your e-mails but all have been bounced off as
undelivered. There is something wrong with your server and I wonder whether
this will reach you.
Sorry, we do not have pictures of HAM-shacks with ACOM amplifiers. Perhaps
you can download such pictures from various web sites.
The ACOM 1010 will be marketed in December 2004.

Best regards,

Mrs. Lydia Vassileva
ACOM Bulgaria

It took me two tries to get a response from Acom. I asked for a complete price list of products and only got pricing for the two amps that I mentioned by part number. I generally don't do business with companies that don't publish their price list, and only contacted Acom because their products look so very good. I don't know why they don't just publish the prices on the web. It would probably cut down their email volume and let them answer other emails in a more timely fashion. Maybe they are quoting different prices to different customers for some reason. Based on the slow responses that I and lots of other folks receive, and the apparent secrecy of the pricing, I think I'll look elsewhere for an amp. If Acom changes the "Price" link at www.hfpower.com to point to an actual price list rather than opening an email window, I'll reconsider.

About a year ago I purchased a pair of Acom 1000's from the UK dealer Vine Antennas... both work faultlessly and are the best quality items of Ham equipment that I have ever owned! Hey stick with it guys the best is always worth the extra effort! Ron at Vine Antennas is a very honest realistic dealer who sells top equipment... and I know wouldn't even consider for a minute, selling some of the other brands on offer - even if they offered a higher margin...

Thanks go to Ron and the Acom team for bringing us some quality equipment...

They are still around, just call them directly.

As an example, I stopped in at the office near Boston and said I wanted an A1000 and wanted to pay via credit card.

What I was told, take the amp with me (back to Canada) and send them a money order. This all done over a hand shake.

Folks, in fairness, you need to contact the local distrubutor in your country, or if you contact Acom International, you need to ask them where they can sell a certain product, what its price is, and who the local distributors are.

In the USA, amps need to meet different import requirements than in Canada, Netherlands, or other countries. It may not make sense to us users, but those are the rules & regs that RF equipment manufacturers have to live with. Perhaps they could communicate these facts better, but sometimes they don't

Fact is, the marketplace is different around the world.

1221. Re: [acom-list] Re: ACOM 2000a info needed.

Yahoo group: acom-list (1999 — 2009)
Date: 2004-09-02 06:27:05 UTC
From: Clay Curtiss W7CE
Topic: 1210 Message: 1221

My comments were specifically about their US distributor. As mentioned in my email, I went to www.hfpower.com (their US distributor) and clicked on "Price" which brought up an email window addressed to k6nd@.... As far as I know this is the only US distributor. If there is another US distributor please let me know and I'll talk to them. I've read through the posts to this group and lack of responsiveness to email seems to be constantly recurring problem with this distributor. Maybe the "big boss" in Bulgaria should look for a US distributor who likes to communicate with potential customers (a high priority with most salesmen). One shouldn't have to stop at the office in Boston to get exceptional service.

1223. Re: [acom-list] Re: ACOM 2000a info needed.

Yahoo group: acom-list (1999 — 2009)
Date: 2004-09-02 13:40:03 UTC
From: Clay Curtiss W7CE
Topic: 1210 Message: 1223

Why? Doesn't their email work? If they want us to call for pricing, then the "Price" link should bring up a phone number not an email window. My real question is: why are the prices such a closely held secret? Acom is the only ham radio product that I haven't been able to find pricing for. I'm always suspicious of companies that won't advertise their prices. It reminds me of the car salesman who tells you the monthly payment when you ask the price of the car. Not exactly the same, but similar feeling.

1224. RE: [acom-list] Re: ACOM 2000a info needed.

Yahoo group: acom-list (1999 — 2009)
Date: 2004-09-02 14:04:02 UTC
From: B Martn
Topic: 1210 Message: 1224

In defense of those companies that do not publish pricing, it☐s usually do to uncontrolled price changes in either certain ☐ingredients☐ or currency fluctuations.

I am in a business that absolutely will NEVER publish pricing. Our raw material costs and/or finished goods, some of which are imported and getting murdered by the wild fluctuations in the value of the US Dollar vs. the Euro make it impossible to print a price. You just have to call and we will be happy to quote you. If you cannot live with this type of situation, whether it☐s our outfit or Acom; then vote for a party that doesn☐t build massive deficits. It☐s the huge quantity of red ink, hence unstable interest rates, hence unstable US Dollar valuation, hence high inflationary pressures, that lead to the inability of commodity based products to be sold via a price list. Sorry, but that☐s life. It☐s not that we are ☐used car☐ salesman or unscrupulous, we are only trying to survive and not sell a product for less than it cost to produce.

Take one look inside of an Acom, and you will see copious amounts of assorted components which are being procured from various sources outside of the factory, many of which are under the gun of inflation not to mention what energy prices are throwing into the mix. And as the US Dollar sinks further, so goes the price of this unit in the opposite direction since it is being imported.

Sorry for the dissertation on economics, but that☐s it in a nutshell.

Bruce is right.

Factories and most big companies never publish prices. This is not wise to do.

And even outlets (big or small) are very careful in publishing their prices. Perhaps their standard pricing, yes.

It is always wise to visit them or at least call them to get knowledge of their actual pricing.

73, Hans Remeeus.

Subject: RE: [acom-list] Re: ACOM 2000a info needed.

In defense of those companies that do not publish pricing, it's usually
do to uncontrolled price changes in either certain "ingredients" or
currency fluctuations.

I am in a business that absolutely will NEVER publish pricing. Our raw
material costs and/or finished goods, some of which are imported and
getting murdered by the wild fluctuations in the value of the US Dollar
vs. the Euro make it impossible to print a price. You just have to call
and we will be happy to quote you. If you cannot live with this type of
situation, whether it's our outfit or Acom; then vote for a party that
doesn't build massive deficits. It's the huge quantity of red ink,
hence unstable interest rates, hence unstable US Dollar valuation, hence
high inflationary pressures, that lead to the inability of commodity
based products to be sold via a price list. Sorry, but that's life.
It's not that we are "used car" salesman or unscrupulous, we are only
trying to survive and not sell a product for less than it cost to
produce.

Take one look inside of an Acom, and you will see copious amounts of
assorted components which are being procured from various sources
outside of the factory, many of which are under the gun of inflation not
to mention what energy prices are throwing into the mix. And as the US
Dollar sinks further, so goes the price of this unit in the opposite
direction since it is being imported.

Sorry for the dissertation on economics, but that's it in a nutshell.
Bruce K1XR

Subject: Re: [acom-list] Re: ACOM 2000a info needed.

Why? Doesn't their email work? If they want us to call for pricing, then
the "Price" link should bring up a phone number not an email window. My
real question is: why are the prices such a closely held secret? Acom is
the only ham radio product that I haven't been able to find pricing for.
I'm always suspicious of companies that won't advertise their prices. It
reminds me of the car salesman who tells you the monthly payment when you
ask the price of the car. Not exactly the same, but similar feeling.

I want to thank all who replied to this. I am sorry for any problems this may have caused anyone on this list. I have sent emails to K6ND@... and have called 508.359.5990 with no repsonse.

I only desire to know approximately how much this amp cost. I have no idea; is it about $4K, $5k....$10K? If anyone from the US has this amp and bought it from the US dealer could you please let me know how long it took you to receive this amp once placed on order. Of course I don't know how one could actually order this item either.

Please email directly to me and not to the list; I don't desire to cause anymore problems. This will be my last email on this subject to the list.

tnx, 73

Date: 2004-09-14 07:14:04 UTC
From: lx1no
Topic: 1230 Message: 1230

Hi folks,

I'm new to this group (took me a while to discover it).

Two days ago, I got the "BIAS TOO LOW AT POWER ON: 000V" message right after the normal heating up period and the amp switches off.

I checked all 6 internal fuses and all seem to be ok. I did not take the big transformer out, I checked with a light.

In an old threat on the hfpower.com site, I noticed that someone had a similar problem. Apparently in his case, the wiring was not so well connected. In may case, all cables from the big transformer to the board seem ok. I did not see/find/smell any bad component.

Unfortunately, I'm not really a tech so it's a bid hard for me to do error tracking.

Question: Did such a problem occur to someone else on this list? What was the cure in such a case?

The dealer I got it from is a 2,5h drive from my place and I'd be happy if I could avoid the trip.

Any hint appreciated. I haven't contacted Acom yet, I thought that maybe this group could be of some help before bothering them.

BTW, the amp is from 2000, if that's of any help.

1232. 6m EME skeds with DX ACOM 1000 owners!

Yahoo group: acom-list (1999 — 2009)
Date: 2004-09-14 13:19:40 UTC
From: Lance Collister, W7GJ (DN27ub)
Topic: 1232 Message: 1232

Hello!

I am very interested in contacting ACOM 1000 owners in new DXCC locations to run 6m EME skeds. Yes, if you have an ACOM 1000 and even a small yagi on 6m, you are in a very strong position to work 6m EME! I would very much appreciate hearing about your 6m station ;-)

For example, recently I completed contacts with single yagi stations LZ3RX, 7P8NK, OH0JFB, 5T5SN, 9A8A and YA1RS on JT65A mode during their setting moon. 7P8NK happened to be using an ACOM 1000 and a 5 element beam. YA1RS was using an ACOM 1000 and a homebrew 6 element beam.

To complete a JT65A mode sked on EME, I would like to find someone with a GOOD 5 element beam (or larger) and 500w (or more). I have already contacted a 200w station using JT65A mode, but he was using a 13m long computer-optimized yagi with excellent ground gain. Of course, good ground gain is very important with such a small antenna aimed at the horizon, and it is good to find a flat plain in front of the antenna toward moonset (of course, salt water is best - HI!).

More information about JT65 and 6m EME is here:

http://www.bigskyspaces.com/w7gj/Welcome_to_6m_EME.htm
http://www.bigskyspaces.com/w7gj/JT65checklist.htm

However, with the new JT1 mode (which is expected to be released soon), I think I could complete a contact with someone 3-5 dB smaller than the station I have described above.

I can propose the best times and aiming info for skeds once I have the grid locator for the station. I look forward to hearing from you and/or any DX stations you can recommend. I am looking forward to some REAL DX contacts via 6m EME!!!! MNI TNX and VY 73, Lance

This is usually an indication tha the relay is damaged or defective.
If you are using QSK, try VOX. If the problem continues, contact
ACOM for service.

From: Bill NY9H
Topic: 1233 Message: 1236

hi all.

i am not an Acom owner/user..... yet.

I notice reference to support for logging programs writelog.
While I use DX4WIN, and it will obviously send a freq to the xcvr...
is the interface with ACOM to provide a freq so it can pretune , prior to
rf being applied????

So if DX4WIN is talking to my ICOM or TenTec ; will the current ACOM
provided software "interface" with DX4WIN ????

Is there another reason to "interface" with a logging or rig control program?

What would I be missing ?

Thanks in advance , and I am certain to have additional questions.....as I
reread the manuals.

Hi Bill,
The existing controller software (Acom Tools) works with Writelog to pretune the amp (via a serial port). Without the software in place, the amp retunes as soon as you hit the first dit. The software works reliably with Win98, but not XP, in my experience. I don't believe it works with any other logging software, but I'm sure someone will correct me if I'm wrong.

It's a great amp, but the lack of decent software to control the amp has been my beef for several years. I'm unaware of any update or new software being written, though some promises were made from time to time.

My ACOM-1000 was dead today. After about 40K QSO'.
No idea why... After few hours of operation (not on the air -
just ON power) the LCD screen was nothing shows. Light and Contrast
is OK, but no any info on screen. Power output is going OK.
Just screen problem ...
Any ideas ?

Andy

I don't have my manual handy, but have you taken off the cover and had a look at the fuses?

Hi,
problem solved. Power supply with white pin connectors -
that was a problem. Not relible part of the PA.
Now working again.

Hello!

I am interested what temperature of tubes on ACOM2000 is accepteble.

Using SSB I have it up to 100 degrees and rear/front tube difference about 8-10 degrees.

I am not sure if it is normal situation. On CW it is never exceeds 80-90 degrees. Any comments?

Regards,

Nodir Tursoon-Zadeh, EY8MM

That seems a little high to me.

1) What power output level are you running?
2) Are you certain that the cooling fan is running?
3) What is the temperature in the room?
4) How much power are you driving the amplifier with?
5) What is your line voltage?
6) Have you looked to see if the inside of the amplifier is dirty?
7) Are the cooling fins on the tubes clean?
8) Are you running with a high swr?

Hello Bob,

Please find answers below.

Regards,

Nodir Tursoon-Zadeh, EY8MM
http://www.qsl.net/ey8mm

> 1) What power output level are you running?

Full legal-1,5. Not red. :)

> 2) Are you certain that the cooling fan is running?

Yes. I can feel it.

> 3) What is the temperature in the room?

About 20 C

> 4) How much power are you driving the amplifier with?
about 45 w

> 5) What is your line voltage?

Depends. 220-240 depends time of the day

> 6) Have you looked to see if the inside of the amplifier is dirty?

I check about 2 month ago. It is clean.

> 7) Are the cooling fins on the tubes clean?

Yes.

> 8) Are you running with a high swr?

1,3 on 20 m (C31XR)

No option fan installed.

Given that you say everything's all right, I would suggest that you use a second thermometer to verify that the temperature reading is correct. The sensors are in the side of the tube chimneys near the top, so you can place the thermometer on top of the cabinet and be reading very close to the internal sensor for the comparison.

I've always seen a maximum of 80 to 90 on SSB, even in the heat in Antigua at V26B during CQWW. The only time I've seen near 100 is running RTTY at too high a power level. No option fan.

Your temps seem to be running on the high side and the difference is large too. I had not more than 2 degrees before my tubes failed. After replacing the tubes, I noticed what you are seeing, only with a 12-15 degree difference. It turned out the tubes were not well matched, and we installed a well matched set. Now I have no difference in temps between the tubes and I rarely go over 80 degrees on SSB.

Hi --

Any tips on how to contact Acom these days here in the USA? I have a 2000A which completes the power up sequence with the
message "HV too low 0.00V" and then goes back to sleep.

I have tried both the old and new phone numbers on the USA website at various times this past week. No one answers and the
voicemail system says it is full. Mail to Will disappears without a trace. Mail to info@hf... bounces back after a couple of days
as undeliverable.

I'm stumped. Help!

I emailed ACOM three weeks ago about needing some minor relplacement parts for my amp and have heard nothing back. No HV - I would check the HV voltage xfmr primary connector - mine was burned up but still working. that was one of the parts I was hoping to get from ACOM.

Any informed speculation on what's going on with ACOM.

Anybody know/try to contact the LZ office lately?

Reminds me of how I dumped my first girlfriend. Perhaps this is her
long delayed revenge.....

It certainly appears that Acom needs help in the marketing department here in the USA. I've been trying to get in touch with them too, because I'm shopping for a new amp and the A2000 looks good. But I've been unable to get any response either to e-mail or telephone over the last 2 months. The last time I called, I got the voice mail and it said the message box was full and couldn't accept any more messages.

The great majority of the good words for Acom seem to come from European users, so I assume the situation is much better over there.

I can imagine the frustration and anger you must feel to have shelled out $x,000 for this box only to find out that when things go wrong you've been hung out to dry. Good luck, and I hope the situation improves soon!

73,

John, K9MM
Former potential Acom customer

If your ACOM is still under warranty..well good luck

If your ACOM is out of warranty, contact Lou De Beer ND6W in San Diego

He is able to effect most repairs.

Lou De Beer ND6W 619 437-8351
lou.de.beer@...

He is NOT an authorized repair facility for ACOM
but he has serviced several ACOM amps and he will
see mine in future if it fails as my warranty is out.

I have no pecuniary interest other than knowing
I have someone competent to service my amp in future.

Try 508-359-2786 (Milara) and ask for Krassy or Will. They have recently moved from Medfield, MA to Medway, MA, but the old 359 number still works.

Hi --

Any tips on how to contact Acom these days here in the USA? I have a 2000A which completes the power up sequence with the
message "HV too low 0.00V" and then goes back to sleep.

I have tried both the old and new phone numbers on the USA website at various times this past week. No one answers and the
voicemail system says it is full. Mail to Will disappears without a trace. Mail to info@hf... bounces back after a couple of days
as undeliverable.

I'm stumped. Help!

Well, if someone speaks emglish at the LZ office maybe a solution would be to just call there.

www.onesuite.com allows you to call LZ for around 16 cents a minute!

How's that for innovation

From: Jim Idelson
Topic: 1260 Message: 1260

Hi everyone,

I spoke with Krassy at Acom today. He asked me to let you all know about some changes at the company.

Acom International has recently moved to a new and larger facility. The company has a new address and new telephone numbers:

Acom International, Inc.
4 Marc Road
Medway, MA 02053

508.533.7765 tel
508.533.7707 fax
866.533.ACOM toll-free in the US

Will Angenent, K6ND, is no longer with Acom. When you call, ask for Krassy. He'll be happy to personally assist with any sales or service requests. You can also reach Krassy at his email address k1lz@...

The transition to the new facility is nearly completed; the phones are up and running. Getting in touch with Acom International should be much easier now!

1261. BIAS TOO LOW -094V

Yahoo group: acom-list (1999 — 2009)
Date: 2004-11-18 18:24:52 UTC
From: Jose Maria
Topic: 1261 Message: 1261

Hi folks:
I'm a new one in the list. Just I have found it looking to solve a problem:
During the "warm-up" the amplifiers tuns off it-self and shows the message:
BIAS TOO LOW -094 V

I contacted to ACOM and they ask me to test some voltages:

I have followed all instructions, and checked voltages needed:

Voltages on the INTERFACE PCB (in respect to the chassis):

1. Form JP3:1 (bias regulator input frp, LV power supply) - it must
be -115...-130V.
--->> (- 124 V)

2. From JP2:15 (bias regulator output to the tubes). It must
be -120...-135)V.
--->> (-122 V)

3. From JP2:2 (bias monitoring voltage returned from tube deck). It must be
about -2.4V.
--->> (-1'84 V)

And all voltages are stable (no changes) during the warmup.
The message shown in the RCU is: BIAS TOO LOW: -094 V

All measures have been taken several times with the same results.

I wait for next instructions, or a solution, but at the moment no answer.

Any help will be very apreciated.

Greetings from Spain.

From: stevehurstg8lik2003
Topic: 1267 Message: 1268

Am scratching my head regarding an intermittent fault on my new Acom 1000 (just delivered).The amp initially ran up OK allowing me to generate RF for 30 secs or so then tripped on SB2F (low airflow-though air is fine and extra fan fitted). After that I could run amp part way up through the filament delay period-for 10, 20 or so seconds from cold before the trip appeared again. tried this throughout the course of the evening and the longer the amp was left switched off before restarting the longer it took for the trip to occur. Tried it again this morning and all was fine even after 30 minutes on standby. No sign of loose connectors on the control board etc.
It was tested on air prior to despatch to me so could be a hard one to find. Its currently a warranty issue but would like to know if anyone else experienced this and what the resolution was.

Thanks for the reply Mike. The dealer I bought it from has been in touch with Acom in Bulgaria and the problem is either the main blower (which seems to be running OK though difficult to be 100% sure as the aux blower also pushes air that way) or the Fan Monitor PCB which monitors the valve blower by rectifying a train of pulses from its Motor Sense. Possibly damaged by rough transportation though all seems in reasonable shape.
I may never know the reason as the amp will be swopped out but hope you guys don't have this one.
Best regards to all, Steve

to access the fault codes on the acom 1000 switch the amp off with the
switch on the front panel then press the oper button this will
illuminate the display and give the fault codes using prev and next
scroles through the fault codes
you can decode the fault codes from the list in the manuale or use the
exell spread sheet from acom

Subject: [acom-list] ACOM 1000 to FT1000MP interface

The following URL describes a QSK connection between an FT-1000MP and an ACOM 2000. Is there any reason why this won't work for an ACOM 1000? In other words, is the T/R switching circuitry the same for both amps?

Just had feedback about this problem from the supplier, The main blower motor has a tacho generator (to prove to the control unit that its rotating!) and this was going intermittent O/C.

1280. Re: [acom-list] Tube Replacement Time?

Yahoo group: acom-list (1999 — 2009)
Date: 2004-12-12 01:06:21 UTC
From: n6ki@juno.com
Topic: 1277 Message: 1280

Hi Barry,

Paul NN6X is supposed to come over Sunday Morning and work 10 mtr contest from my QTH.

Just wondered what responses you got from the tube replacement
query ?

With my Alpha 78 amp in the past I would watch how much grid current
was when amp was tuned for 1500W out in Bird meter and Bird load. As tubes aged, it
required more grid current on the 3CX400A7 tubes (8874)

Wonder if same scenario works for the 4CX800s ?

73, Dennis N6KI

1281. New poll for acom-list

Yahoo group: acom-list (1999 — 2009)
Date: 2004-12-16 20:17:10 UTC
From: acom-list@yahoogroups.com
Topic: 1281 Message: 1281

Enter your vote today! A new poll has been created for the
acom-list group:

Have you had any problems with Acom
answering your emails or phone calls?

o Acom never answers emails or phone calls.
o Lots of problems but if I call or email enough then sooner or later I get a hold of them.
o They usually reply within a month or two if im persistan.

To vote, please visit the following web page:
http://groups.yahoo.com/group/acom-list/surveys?id=1554019

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

From: Steve
Topic: 1281 Message: 1284

Mike, I understand that discussion of the many technical problems of the amp is important. But service support for current and future owners is also important. When a customer needs help with a $6,800 amp don't you think they should get proper attention or at least have a phone call returned or an email answered?

You can voice your opinion in the poll or just be quiet and let us discuss this issue. But please don't try to silence our voice on this.

But Steve, if you are going to do a poll, try to be fair and open. As I said before, I couldn☐t respond to your poll, because you don☐t cover all the options. Not only have I had good luck with the 2000A, but when I needed help Acom has been quick and responsive. By your listed questions it does not seem like you want to hear from folks that are satisfied with Acom. So in other words, you just want to gripe.

From: Carl Moreschi
Topic: 1281 Message: 1288

How about at least one positive choice that says "they answered my calls in a reasonable fashion", which is what they did with me. What kind of poll has all negative answers? I can't take the poll since I had a positive experience.

1289. Poll

Yahoo group: acom-list (1999 — 2009)
Date: 2004-12-17 15:30:59 UTC
From: Hal Kennedy
Topic: 1289 Message: 1289

Every time I have ever called Acom I got Will or Krassy on the second or third ring. I see no option to vote for good service - which is all I have ever received.

I don't understand the nature of a poll that is set up with a predetermined outcome.

Hal,
N4GG
(Happy owner of two 2000As)

Steve

In order to make this fair, you have the option to answer what appears to be 3 negative comments.

You need to add 3 choices on the positive side.

There are 3 types of lies. Lies, Damn Lies and Stats. I know, I used to do it for a living. Give me a set of numbers and I can prove whatever you want to see.

That being said. I have not had a negative problem with Acom to date. I've very happy with my product and the people I deal with.

From: Neil King
Topic: 1281 Message: 1291

Carl,

In my opinion this isn't a poll, it's a troll. I gave it the attention it deserves by deleting the message after reading.

My experience with Acom has been very positive. If and when an objective poll is presented I'd be happy to participate.

Neil

How about at least one positive choice that says "they answered my calls in a reasonable fashion", which is what they did with me. What kind of poll has all negative answers? I can't take the poll since I had a positive experience.

Could you repost the link, Steve?

I want to vote (positive response from Acom), but the only link I could find still has only negative choices. I'll wait to vote until something positive can be said.

1295. ACOM Poll re: Service

Yahoo group: acom-list (1999 — 2009)
Date: 2004-12-17 16:39:07 UTC
From: ah6fc
Topic: 1295 Message: 1295

Every time I've called ACOM, Krassy answered the phone himself. My concerns have always been promptly addressed. Krassy followed through on his promises promptly and fully. Though emails have not always been answered promptly, they always have been within a few days. This survey is rather leading toward a desired (negative) result. If a survey is created it really should be objective and non-biased.

I just received an ACOM 1000 and it's a great piece of equipment, packed well, delivered as promised, and with great documentation. You'll not be sorry if you purchase an ACOM from Krassy.

73's & Aloha,
Bill

Survey Response,

Two years ago, at Dayton, I purchased an Acom 1000. I had a few minor questions that were rapidly and expertly answered by Acom and, had to build a relay that prevented the "hot-switching" sensor from shutting the amp down with the way my Icom Radio(s) keyed the amp. I have used the Acom 1000 for numerous contests with not a whisper of problems to date. I am a very satisfied owner.

Yahoo group: acom-list (1999 — 2009)
Date: 2004-12-17 17:37:05 UTC
From: Henry Ingwersen, KT1J
Topic: 1281 Message: 1297

Steve,

So which block in the poll do I check:

I own an ACOM 2000A/2000S and an ACOM 1006, and I purchased an ACOM 1000 for a friend, N1JEZ. All three have performed extremely well and are used at home and off-site during contests and dxpeds (CY9, 2 x FP). Two problems were encountered several years ago with the 2000A, an early model, both related to the molex connectors. The first one I was able to resolve at home with detailed instructions received on the phone from Krassy at ACOM International in Massachusetts. The second one was done at the shop in Massachusetts with very quick turn-around. I have since had numerous telephone conversations with both Krassy and Will. They would always bend over backwards to provide information and advise. Yes, I may have had to call twice, even three times, but at least I did not have to go through a call menu and then end up with some idiot who did not know his product.

Also, the list presumably has an international readership, so when you say "ACOM", are you referring to Sofia, Teteven, Medway, (MA), Paimio, Antwerpen, or Omskoldsvik (etc.)?

Last question: Once you have the results of the poll, then what?

Henry,

KT1J (Vermont), PA0AFN
and a happy ACOM customer

1299. Re: New poll for acom-list

Yahoo group: acom-list (1999 — 2009)
Date: 2004-12-17 20:45:17 UTC
From: lx1no
Topic: 1281 Message: 1299

Hi,

> Also, the list presumably has an international readership, so when you say "ACOM", are you referring to Sofia, Teteven, Medway, (MA), Paimio, Antwerpen, or Omskoldsvik (etc.)?

I side this. "Which" Acom do you mean? Acom-USA or Acom-"worldwide"? If you want a poll about Acom-USA, define it as such. If you mean any other Acom vendor or Acom-LZ, define it as such. I'm VERY satisfied with Acom-LZs support. They helped me fast (within 24h which is quite reasonable) and very precise on two occasions. No need to complain at all.

If you got trouble in the US with Acom, please don't judge on what's going on accross your border line.

My two eurocents,
73 Norby

1300. RE: [acom-list] ACOM Poll re: Service

Yahoo group: acom-list (1999 — 2009)
Date: 2004-12-17 21:23:49 UTC
From: B Martn
Topic: 1295 Message: 1300

I have to say I had some troubles contacting Acom when my 2000A acted up with a problem, but ultimately I not only got through to Krassy, but he personally drove up to my QTH in Maine on a Sunday last July with a box full of new GU74B's to match properly in my amp on site! Plus he readjusted all the proper voltages after the install and I must say the amp operates better than when it came to me as new. It was very good service in my opinion.

Subject: [acom-list] ACOM Poll re: Service

Every time I've called ACOM, Krassy answered the phone himself. My concerns have always been promptly addressed. Krassy followed through on his promises promptly and fully. Though emails have not always been answered promptly, they always have been within a few days. This survey is rather leading toward a desired (negative) result. If a survey is created it really should be objective and non-biased.

I just received an ACOM 1000 and it's a great piece of equipment, packed well, delivered as promised, and with great documentation. You'll not be sorry if you purchase an ACOM from Krassy.

73's & Aloha,
Bill

From: Barry
Topic: 1295 Message: 1301

The poll was done with an obvious agenda in mind. However, the idea
was good as there have been many new list subscribers over the last
few months looking for exactly this kind of feedback, so keep it
coming.

Yahoo group: acom-list (1999 — 2009)
Date: 2004-12-17 23:05:22 UTC
From: Steve
Topic: 1303 Message: 1303

Well, the pen (keyboard) is mightier than the sword. It only took all this and finally my email to ACOM USA has been answered. I will now have to go to the poll and change my answer.

I plan on ordering an amp but at $6800 I would like to know if there is some support and service from the company. I guess if I ever have problem with ACOM USA again I will have to go thru all of this to get it fixed.?!

... -.-

1305. RE: [acom-list] Re: New poll for acom-list

Yahoo group: acom-list (1999 — 2009)
Date: 2004-12-18 01:49:25 UTC
From: N2TK, Tony
Topic: 1281 Message: 1305

Well Steve, I did not see a change in the questions. So will iterate my experience with Acom. I bought one of the early 2000A□s. We first tried them out at V26B. Krassy brought them down there. They worked well for the contest. I brought it home. It developed a problem. The early 2000A□s had a problem with the connector with the heater line. I was going to Boston on an overnight business trip. So I dropped it off at Krassy□s office. The next morning I picked it up. He had repaired it the previous evening and tested it. Brought it home. Mounted it on a shelf near the ceiling in the basement where my coax enters the house, Use the RCU to control it. Haven□t paid any attention to it except for once a year I take off the cover to check for dust. There isn□t any. I had bought the external fan option. I cut up a dense furnace filter and mount it on the external fan. Every year I change the filter. It keeps the dust out. It works great.

1306. RE: [acom-list] Re: New poll for acom-list

Yahoo group: acom-list (1999 — 2009)
Date: 2004-12-18 02:29:55 UTC
From: Alex
Topic: 1281 Message: 1306

Hi everybody,
Finally the comments on the acom-list means more than
the intented poll ..hi. Anyway I can not access the
poll site.

I am another happy user of 1 x ACOM 2000 and 2 x ACOM
1000.
I had excellent support from Sofia team (Lydia, Vasco
and Stan).
I wish I had a 2 m ACOM amp also..

73,
Alex

1307. RE: [acom-list] Re: New poll for acom-list

Yahoo group: acom-list (1999 — 2009)
Date: 2004-12-23 22:32:43 UTC
From: Chris Burbanks
Topic: 1281 Message: 1307

Just returned home after a few days away and seen this thread. It really is in bad taste and poorly thought through. Which agents and which countries? I own an Acom 1000, it has worked perfectly during the 18 months I have owned it. I have used it in a number of contests with no problems. On purchase the UK agent was very friendly and efficient. I had cause to ask a question about keying via FT1kMP and received a prompt response from Stan in Bulgaria. I know the UK repair person and have every confidence that he would provide good service if required. I have used an Acom 2000a during a major contest and again found no problems.

Chris G3SJJ, op at G8D and GU8D.

Subject: Re: [acom-list] Re: New poll for acom-list

Steve,

So which block in the poll do I check:

I own an ACOM 2000A/2000S and an ACOM 1006, and I purchased an ACOM 1000 for a friend, N1JEZ. All three have performed extremely well and are used at home and off-site during contests and dxpeds (CY9, 2 x FP). Two problems were encountered several years ago with the 2000A, an early model, both related to the molex connectors. The first one I was able to resolve at home with detailed instructions received on the phone from Krassy at ACOM International in Massachusetts. The second one was done at the shop in Massachusetts with very quick turn-around. I have since had numerous telephone conversations with both Krassy and Will. They would always bend over backwards to provide information and advise. Yes, I may have had to call twice, even three times, but at least I did not have to go through a call menu and then end up with some idiot who did not know his product.

Also, the list presumably has an international readership, so when you say "ACOM", are you referring to Sofia, Teteven, Medway, (MA), Paimio, Antwerpen, or Omskoldsvik (etc.)?

Last question: Once you have the results of the poll, then what?

Henry,

KT1J (Vermont), PA0AFN
and a happy ACOM customer

1308. Re: [acom-list] Re: New poll for acom-list

Yahoo group: acom-list (1999 — 2009)
Date: 2004-12-24 12:34:38 UTC
From: alsopb
Topic: 1281 Message: 1308

Chris,

With all due respect, you missed the point.

1) Nobody has complaints when the unit is working.
2) The problems/complaints occur when the unit isn't working and you
can't get if fixed.
3) Past history of good service doesn't help a bit when one is trying
to get his problem fixed now without manufacturer response.

The poll you see is the result of frustration. The owner of a $6K
black box who can't get anybody from the manufacturer to respond to
them is rightly upset. It's that simple. Just because you and many
EU people are having good luck with the EU response, it doesn't mean
people in the US are. The "poll" and addition responses by US owners
clearly indicates this split in service response.

What better place to bring these type of problems to light than the
reflector? Shouldn't other ACOM owners know about these difficulties?
It would seem you are saying that it is in bad taste. I don't agree.

Given the recent posts on the new phone numbers/relocation of ACOM,
lets hope the US problem is solved. Since I own a 4+ year old
ACOM2000, I sure hope so.

I think that with only 10 votes, this poll is not going to serve any purpose. It certainly will not provide any insight into what's been going on here in the U.S.

Also, with Will leaving Acom, it's obvious that something's been going on that we don't have knowledge of.

Let's hope things will get back to "normal" after these changes.

I've had my ACOM 1000 for about 2 weeks now. It was working fine until a couple of days ago. Now, I am getting ARC Faults all the time. My VSWR is great (1.2:1 or less). I've tried lowering the power. Nothing seems to help. Anyone know what ARC Fault means and how I correct the problem?

Do you Yahoo!?
The all-new My Yahoo! ? What will yours do?

Generally speaking, it means that something is wrong with (or has changed in) your antenna system that the protection circuit sees as arcing. I would look closely at your antenna for something that changed physically. It is possible that something in your amp has failed, but that's not likely. For example, the end of a dipole might be rubbing against a tower leg, or fence, or aluminum gutter or ? It is also possible that a connector has failed and has burned.

Try a different antenna or dummy load to confirm the problem.

For N6KJ:

I recall a friend having a similar problem during the IARU Contest earlier this year at on eof the GB5HQ multi-multi staitons. A vacuum relay was the problem in the antenna changeover line and this was repaired FOC under warranty in the UK. The Acom 1000 in question had been barely run in at the time as it was almost new. I heard later that a bad batch of those relays had been fitted to several Acom 1000s - heresay though and not confirmed. It could be that is your problem.

I have an Acom 1000 and have found so far to be 100% reliable after 2 years use.

Topic: 1310 Message: 1314

Adding an amplifier can cause PL-259's and their soldered connections to breakdown if they are marginal. If none of the other suggestions work check your soldering.

I've had my ACOM 1000 for about 2 weeks now. It was working fine until a couple of days ago. Now, I am getting ARC Faults all the time. My VSWR is great (1.2:1 or less). I've tried lowering the power. Nothing seems to help. Anyone know what ARC Fault means and how I correct the problem?

Hi All Happy New Year!
I had a similar fault displayed intermittantly, this was traced to a loose/corroded connection from my balun to driven element on Cusshcraft X7... fixed this connection - no further problems..

Yes . . . that Arc Fault is really a great detector of problems. You want to be absolutely certain that the problem is not in the antenna/feedline/switching before suspecting the amp. Best to load up on the frequency where problems exist into a dummy load with a really good quality short cable . . . and do the standard amp tuning . . . if that doesn't work, then maybe look at an amp problem.

73,

Jim

Thanks for all of the input everybody. I found the problem. One of my PL-259's was not screwed on tightly enough. It looks like things are back to normal.

Anyone know where I can get a list of all the possible faults and their causes? I didn't see "ARC Fault" Listed in the manual. I assumed it mean "ARC", but wasn't sure where it thought the ARC was. More info in the manual would be nice, but if anyone has more info on other possible faults I'd appreciate it. Thanks again. Have a happy new year everyone. I'm very happy with my ACOM 1000 so far!

1321. ACOM2000a LOW HEATER CURRENT

Yahoo group: acom-list (1999 — 2009)
Date: 2005-01-12 11:56:08 UTC
From: lfe73
Topic: 1321 Message: 1321

The LOW HEATER CURRENT fault just started this morning. Nothing changed other than amp kicks off this am with the LOW HEATER CURRENT 1.6A fault and won't turn back on. It had been on and idiling for about 1/2 hour before it kicked off. Mains Voltage and 220VAC outlet voltage checks fine. Tube gone?

1322. Re: [acom-list] ACOM2000a LOW HEATER CURRENT

I would take the bottom cover (the one just below the tubes) off and
check a connector which has two white wires going to it. I think you may
find that this connector has failed. This connector is located in the
corner and a close inspection is required. Solder the wires directly to
the circuit board.

Probably not the tubes. Check the two pairs of white molex connectors in the heater line. If they've turned dark, from overheating, that's your problem. Replace or solder straight through.

I cannot tell you what is going on with the heater voltage issue, however Henry has addressed that issue. But if anyone ever sees a fault that says something on the order of "screen voltage on before warm up complete" and the amp shuts off, you have a bad tube most likely. I was getting this one for a short time and the amp would start as soon as I hit the warm up key again. At each start up, the amount of resets I had to do to get the amp to turn on increased until it would not start at all, but only trip out.

Krassy came up and changed out my tubes with new matched ones, and the problem went away and I have not had an issue since.

1327. Bonus effect

Yahoo group: acom-list (1999 — 2009)
Date: 2005-01-22 15:07:42 UTC
From: k2hk_2000
Topic: 1327 Message: 1327

Last night I discovered a new added feature of my Acom 2000. After starting my linear I noticed the heater LED blinking, indicating a warning that the filament voltage was approaching the high limit. I checked the measurements and discovered my mains were at 267 Volts AC and the heaters were at 13.8 Volts. These voltages although high were still within the operating parameters. A short while later I noticed the linear had turned off with the message that the heater voltage was above 14.4 Volts. From that point I could not restart the linear. When checking my mains voltage with a voltmeter it was 272 Volts AC and the 110 lines in the house were at 134 Volts. this occured at 10 PM at night. A call to the power company got a truck and crew here at about 11PM. On a night when the temperature was at minus 10 F they switched out a faulty pole transformer. It took them about 20 minutes once they had the transformer at the location. One of the advantages of the high voltage before the repair was extra bright lighting which enabled me to see all the dust I had missed in the shack. Thanks to Acom for saving my house appliances.

1329. Re: Extra fan for Acom 1000

Yahoo group: acom-list (1999 — 2009)
Date: 2005-01-23 01:21:15 UTC
From: Serge Stroobandt
Topic: 1153 Message: 1329

Dear Phil,

Reading your messages about mounting the extra fan for the ACOM 1000
are very helpful.

I have one additional question though:
Have you considered leaving the mesh filter in its original place and
placing the fan with an additional carbon filter on top?
This way, the RF shielding of the amplifier would be preserved.

For the other readers:
In Zürich, Switerland (Pusterla), I found a SUNON branded fan 92mm
square 24VDC 3.6W. Model number: KDE2409PTS1-6
As you may infer from the above, I still need to test it.

Paul,

I'm not certain what the correct color is, but I know that if you find a well-stocked hobby shop, they will have many different kinds of paint for airplane models. The selection of colors and finishes is amazing. One of them will likely match perfectly.

Henry,

I have not called Krassy yet but if I can't find something local then I will call him. I'll also check the hobby shops as suggested. BTW, does everybody realize that the price on the Acom amplifiers has gone up because of the decline of the dollar in Europe? The Acom 1000 is now $3250.00 and the Acom 2000 is now $6850.00 (according to Krassy when I spoke to him earler this month). This Acom 1000 really is a no non-sense amplifier. I can see why it has all 5 ratings on Eham.net.

Paul,

I hate to say it, but get used to ever escalating prices on most everything we buy from now on. The US Dollar is currently trading at 1.30 ish on the Euro, and expected to decline further to the 1.60 range over the next year or so. Also ex-Fed Chairman Volker was quoted last week as saying he believes the US has a 75% probability of a full blown dollar crisis within 5 years. I don't know what that means quantitatively in terms of value, but I am afraid to ask.

The price of an Alpha 87A is also trading up around the price of the Acom, so this is the range of top of the line amps. But don't forget, the Japanese products will go up too as the dollar continues to fall. Did you ever think you'd be looking at Icom transceivers in the $11K range? Don't tell me there is no inflation.

I was watching Lou Dobbs last night, the new projections coming out for the deficit are now an astounding, shocking, amazing, not even comprehensible $875 billion next year. And you thought $400 billion was not believable, this is on the way to Mars. Better buy your Acom now boys, while you have any money left at all. All I can say is, I am very proud to be a responsible American to have NOT voted for the party that created this mess, and I for one will not cry when the next down draft comes in like a tsunami..probably starting with our home valuations collapsing as real interest rates take off. It's just too bad there were not enough of us.

Bruce, you should keep your political views to yourself. This reflector is about ACOM amps, not a forum to discuss your failed views. Live with it, you lost. Now try to be constructive and don't put this type of stuff on a reflector, unless it is a moveon.org reflector.

Sig,

If you understood economic viewpoints (and maybe you do) and the dynamics of what is going on, you certainly would not call my views "failed". However, the discussion was brought up concerning the pricing of the Amps based on the falling US Dollar; I am only following the lead of the topic. If you voted for this, then "you" are the one that has to live with this; it will be your problem. Me, I have made my preparations to "deal" with what is going to happen. I only wish you guys out there luck if you have not done so yourself. So let the blind lead the blind,

Enjoy,

Bruce

Sig - apology accepted. We all hit the wrong TO: button from time to time.

Bruce (and others contemplating a response) - Politics is not acceptable on this list, even under the guise of an Acom-related topic such as cost. I refrained from replying earlier, figuring it would die on its own. Let's nip it in the bid now.

1339. Question about 6 meter and HF

Yahoo group: acom-list (1999 — 2009)
Date: 2005-01-29 20:40:12 UTC
From: hfdxjunkie
Topic: 1339 Message: 1339

Hello group, I am currently on the waiting list for the 1000A. But now thinking about it , this just might be a problem unless there is a good fix. I planned on putting a Bird antenna switch from the output of the amp to switch from hf antennas to my 6 meter antenna. But my problem is this. I run a TS-2000X for 6 meters and a Mark V for HF. If I am using the amp on HF with the Mark V, how do you monitor 6 meters from the other radio without disconnecting the coax from the switch and going direct? I have thought about doing it a few ways but doesnt seem there is no easy way around it, its either listen to 6 or listen to HF. I dont think 1 input and 1 output is too good of an idea for there amp. Even HF/6 meter rigs have seperate outputs for both bands. Anyone else think of a good easy way around this? Besides using 2 amps?

Thanks for any input, 73 Pete

The easist way to get around this problem is to use an Icom 756 Pro III. Just kidding...

Seriously, there are solutions to this such as the Array solutions Ampmaster:
http://www.arraysolutions.com/Products/transcoswitch.htm

It's a bit pricey, but would do the job.

73,

Bob N5NJ

Not much help, but it works just fine with an Icom IC-756 which can use
either socket for any band.

1342. 2000A Relay fault help.

Yahoo group: acom-list (1999 — 2009)
Date: 2005-01-30 21:40:54 UTC
From: Salvatore Console
Topic: 1342 Message: 1342

Hello all,

My Acom 2000A started to develop an intermittent problem.
While sending CW the amp would shut down and the controller would
say "Relay Closed it Should be Open".
Does this error mean the antenna vacuum relay or the relay
on the Phase Detector???

Does anyone have any info or suggestions on this problem??
Any help would be very much appreciated...

73, Ted K2QMF

1343. What's causing Acom 1000 Auto protection fault: PN07

My 1000 kicked off during transmission and began flashing Auto protection PN07. Does not reset with AC power recycle on. Does this mean that I have lost High Voltage (analog) whatever that means? Any trouble shooting pointers would be appreciated.

This a follow-up to my above:

Sent the amplifier back to Acom for testing and repair but after extensive testing and evaluation by Wil and Krassy the trouble could not be replicated by Acom. It appears that this was just a tempory glitch and it cleared itself. I have been running the amplifier without a hitch for several days now and the origial problem has not returned. This is still the best amplifier in its class on the market. GO ACOM!!!

73 all,

Bob KW4CQ

1345. ACOM 1000 Standby Power Consumption

Does anyone know how much power the ACOM 1000 consumes in standby?

1346. ACOM 2000 CONFUSED?

Yahoo group: acom-list (1999 — 2009)
Date: 2005-02-27 23:09:01 UTC
From: k0dan
Topic: 1346 Message: 1346

Hello group...

I was operating 17M SSB today, I don't often get on 17.

I noticed I could hear the ACOM's servos occasionally during voice peaks. Very short bursts, like they were tweaking the amp, shorter duration than when you switch bands and the amp adjusts after a QSY.

The amp seemed to happy, antenna network SWR was about 1.25:1, ran legal limit, no alarms or shutdowns.

I noticed that as the servo "tweaks" were occuring, the band segment on the control box was changing...as if the ACOM was confused and was not sure what band segment I was on!

The station I was in QSO with reported nothing noticeable.

I did try the ENTER-ENTER manual tune procedure (probelm reamined) and also tried transmitting into a dummy load (problem remained).

All cable connections appear tight, there is no sign of RFI. Good system grounding.

Not sure this is happening on all bands, will have to check that out further...it seems I was on 15M a few days ago and was aware of hearing servo noise, but paid it no attention at the time.

Has anyone had this happen, have any ideas what's going on?

Thanks and 73,

Dan

From: alsopb
Topic: 1347 Message: 1347

Hi Dan,

I had the same thing happen in the 160M SSB contest. I was 1 KHz above 1825KHz on LSB. As I talked the amp sometimes switched segments.

When you think about it, the amp senses the RF freq. It uses the sensed frequency to determine the segment it should be in. When you talk the frequency covers a bit more than 2KHz. Thus it could have sensed some RF at 1824 KHz and determined it should be within the next lower segment.

I don't know how enough smarts could be put into the unit to avoid this.

Fortunately as the frequency increases, the size of the segments gets larger. The chances of being close to a segment boundary get less and less. Perhaps 160M is the worst case.

Hello:

I am considering buying an Acom 1000. I would use it for RTTY contesting from home. Comments on this would be appreciated:

- The extra fan would be suggested?
- With that fan, how much output power is expected?
- Any other comments?

73 - Kristinn, TF3KX

The extra fan is a small price for peace of mind and enhancing reliability under heavy duty cycle. The amp is rated to run 1kw continuous when this is fitted and I have tried mine 1kw+ out with plain carrier for an extended period into a load and all is happy. It really is a wonderful amp and so well protected. A real good buy.

Yes, and certainly for use with full duty cycle modes such as JT65A on 6m EME, the extra little fan will be a very welcome addition! GL and hope to see more of you ACOM 1000 owners on 6m! The amp has rapidly gained a reputation as being a REAL SUCCESSFUL PERFORMER on 6m EME, and is the choice of DXpeditions for that application! GL and VY 73, Lance

Here are additional question on the Acom 1000, relating to the extra optional fan:

- Is it difficult to install or remove?
- Can it be turned off separately, to keep noise down?
- Is this an "appendix" of some sort to the amplifier? I.e. does it fit inside or is it a prominent addition to the amp's size? Does anyone have photo of what this looks like (may be sent to me at tf3kx@...)?

Had ordered my A1000 including the fan from Vine in the UK.
Don't know if he use the original one but the one he used is very
quiet.
You don't notice it is on.
Compared with a college who instaled one himself, it's a big
differece.
His one makes a lot more rpm's and therefore more noise but....
His amp's temperature is lower.
15 minutes keydown full power mine is 80 celcius his is 55 Celcius.
conclusion:
more RPM's is more noise but lower the temperature.
The choise is yours.

The fan I have is about 3,5 cm extra on the outside of the amp

gd luck

Hugo

1356. Acom extra fan

Yahoo group: acom-list (1999 — 2009)
Date: 2005-03-10 16:15:04 UTC
From: stevehurstg8lik2003
Topic: 1353 Message: 1356

Interesting to see the comments regarding exhaust air temp with the fan fitted before delivery as mine was-and similar results.
Perhaps a more powerful fan would have been worthwhile but I wonder if anyone knows-how does the valve temperature equate to exhaust air temp?
The valve spec is 200C maximum. I note from the detailed Acom info (maintenance instructions available by email request from Acom in Bulgaria) referring to the trip settings that the Amp will warn once 130C exhaust air temp is reached and trip at 150C. Is it reasonable to infer that the valve anode is typically 50C hotter than that of the exhaust air?

All I can say is, WOW! MNI TNX to ACOM for coming out with this fantastic amp! The new weak signal digital modes place an EXTREMELY demanding load on any amp, and the ACOM 1000 continues to demonstrate it is up to the task :-)

This amp is rapidly emerging as THE AMPLIFIER of choice for 6m EME DXpeditions! I worked OX3LX last night with his off the moon for my 6m country #94, and also credit the now-famous ACOM 1000 with at least 3 other very rare countries (including YA and ST) that I have gotten via 6m EME.

I HOPE I will be able to include FT5XO in the group of rare new countries worked via 6m EME, but have not had a common moon window with them and their ACOM 1000 yet. Nevertheless, they have worked 5 stations so far via EME, and have been copied by stations all over the world.

TNX again to ACOM for your great product and support! VY 73, Lance

Hello,

Lets see if anyone can help

I have 2 transceivers: 1 ICOM 775DSP and 1 ICOM 736

Amplifier is ACOM2000A

The 775 keys the linear with no problem through the
send rca rear connector. The 736 no.

The manual shows the following specs for the internal
relay:

16 VDC - 2A for the 736
24 VDC - 1A for the 775

Any idea or proven circuit to use as external relay?

Thanks

Marcel

Dont see any reply on this one. Should key just like the 775 does. Have you checked with an VOM to make sure the relay in the 736 is actually shorting the center pin to ground? Perhaps the relay in the 736 is bad?

Marcel Jorba <ea3in@...> wrote:Hello,

Lets see if anyone can help

I have 2 transceivers: 1 ICOM 775DSP and 1 ICOM 736

Amplifier is ACOM2000A

The 775 keys the linear with no problem through the
send rca rear connector. The 736 no.

The manual shows the following specs for the internal
relay:

16 VDC - 2A for the 736
24 VDC - 1A for the 775

Any idea or proven circuit to use as external relay?

Thanks

Marcel

Marcel:

Not familiar with the 736, but a lot of rigs have a menu option to turn external relay keying either on or off. Might check that.

Good luck,
Frank, W7ND

Thanks for all answers.

I discovered that my microham intarface includes an
amplifier heying buffer.

It works ok

1368. Re: Acom 1010

Yahoo group: acom-list (1999 — 2009)
Date: 2005-04-08 12:22:45 UTC
From: Didier Divorne
Topic: 1162 Message: 1368

Hi,

I've seen new specifications about the 1010. Some specifications were
improved. P.exe:
- 1'000W and not 700W
- HF+6m and not HF only
- ...

Source: http://www.hfpower.com/

Questions:
- have the "new" 1010 a good QSK system (vacuum relay) or not ?
- what is the price of this PA ?

The infos on hfpower.com are suspect...

this page (Acom 1010):
http://www.hfpower.com/new/a1010spec.htm

looks like this one (Acom 1000):
http://www.hfpower.com/new/a1000spec.htm

Had somebody from Acom made a mistake or an unwanted copy/paste
or are the new specs really true ?

.....

From: Hans , PA3HGT
Topic: 1370 Message: 1370

Hello all,

I tried to get te manual for the 1010 but all what i get is : Error .
And the specs .... The 1010 was only for HF and not with six meters ?
It's seems that the specs are from the 1000.
I send Will an email about the manual but no answer yet.

Good job Acom !

1376. QUESTION

Yahoo group: acom-list (1999 — 2009)
Date: 2005-04-12 15:18:42 UTC
From: William Beyer
Topic: 1376 Message: 1376

OK to put 200 watts thru the ACOM 2000A with the unit off?

200 watts from FT-1000d or IC-7800 or FT-9000DX?

What is the max drive power?

Bill

From: LY2TA
Topic: 1376 Message: 1377

Max drive power depends of band/antenna.
Usually to have full legal power from ACOM 2000A
enough 40-65W out from TS850S/AT here.

Bill

If your concern is with acom in stand by a running 200 watt radio you may need to reduce the drive power down to 150 watts I am running the 781 on the 2000A when not keying the amp I will run 150 watts output on the rig I belive it is approved for 200watts from exciter in standby If your running wire antenna I will get an overdrive on the amp in standby So the amp is perrty Bullitt Proof , when the amp is on 40/55 watts drive is all that is required to drive the amp to legal limt.

Date: 2005-04-13 03:02:13 UTC
From: kg4lru@aol.com
Topic: 1376 Message: 1384

Yes you can but anything over 200 watts the amp is not approved for if you have it standby you will get overdrive indications if pepe is over the max 200 watts since you have it off you can still damage the circuit you our not getting the warning is all.

1385. Acom 2000a and Icom 781 alc spike

Yahoo group: acom-list (1999 — 2009)
Date: 2005-04-13 03:15:11 UTC
From: kg4lru@aol.com
Topic: 1385 Message: 1385

Anyone running the 781 with the acom 2000a that is having still having spike problems there is simple fix to your 781 that will fix it for good .

This the link for the fix
http://www.mods.dk/forum.php?action=ViewArticleThread&ModsId=288
(http://www.mods.dk/forum.php?action=ViewArticleThread&ModsId=288)

Be sure to read messages on the alc mod that comes up the fix is in the message area . The mod will require a good alignment on your 781 so all the voltages will be correct but it does work and it now will perform as the factory should have designed it.

1386. Latest ACOM 1000 US Price?

Yahoo group: acom-list (1999 — 2009)
Date: 2005-04-13 15:27:07 UTC
From: kb7our
Topic: 1386 Message: 1386

What is the latest US price for this AMP? I bought one from Will 1 year ago but it isn't getting much use - barely a few hours at most. I bought 1 extra tube from RF Parts for safe keeping. My latest renewed interest in flying and astronomy means that QRO is taking a back seat for a few years so the AMP is just sitting on the desk looking pretty. If I decide to sell is it ok to post that here? Not looking to make money but I would like to get what I paid since they have gone up as I understand. Mine is absolutely mint with original receipt from Will with serial number and manual. Selling will buy me some good hours of flight training :)

1388. Looking for a list moderator

Yahoo group: acom-list (1999 — 2009)
Date: 2005-04-17 23:18:07 UTC
From: Barry
Topic: 1388 Message: 1388

Hi all,
In case you didn't know, I started this list in 1999 and am the list moderator. Fortunately, this is a very well-behaved group and my housekeeping chores are minimal.

I've never had to ban anyone, other than an occasional spammer who signed up for the list before memberships had to be approved, and rarely had to curtail off-topic threads.

For the most part, all I do for this list is approve memberships. If someone doesn't give enough specifics in their sign up request, I ask them a few questions to make sure they belong (like "what is your callsign?" and "what's an Acom?") It's a no-brainer if they sign up with an email address like w3xyz@..., but a lot of throwaway email addresses are used, too.

Where am I going with this? Nowhere, really, other than I am looking for someone else who is willing to be a list moderator. In the past, if I've been away, the subscribe requests just wait. This time, I'll be away longer than usual, so I thought someone else should be available to do it.

I will be away for a few weeks in June (going to participate in HST2005 in Z3-land), and need someone willing to do the sign up approvals, etc. during that period. On average, there are maybe 2-3/week (and there are currently 240 active list members.)

If interested, please email me directly (not the list.) If I get multiple requests, please don't feel insulted if you are not selected.

Tnx,
Barry W2UP--

From: alfihey
Topic: 1394 Message: 1394

Hello to you all,
I'm new to the group and have a question regarding the firmware of ACOM 1000 amplifiers. Is the vers. 4.0 from June 2002 the current version and what's the difference to the vers. 3.0 from October 2001. How one can make an update?
Thanks in advance, Alfred, DL2JR

1395. acom touch up paint

Yahoo group: acom-list (1999 — 2009)
Date: 2005-04-26 19:27:22 UTC
From: shapiro_martin
Topic: 1395 Message: 1395

Hi gang, I have a 2000A just shy of 3000 hours and purchased around mid 2001
the RCU had some paint off the edges and I've been looking a while for some touch up paint...
Well I think I have found something very close!

model master acryl paint:
bottle number: #4797 name: panzer schokladnbraun r 1/2
upc code: 7561113102
company name: the testor corp. rockford Illinois
www.testors.com

I found this at a well stocked hobby shop here in Phoenix Arizona. Look in the military model paint area. This is a german military tank model color
cost... about 3 bucks 1/2 ounce

The paint needs to be mixed/shaken really well to blend the colors. I used a toothpick and gently applied two coats on the areas missing paint.
The paint drys a bit darker than when it's applied so don't panic.

up close you may notice the difference but at arm's length it seems to blend nicely. I believe for small touch ups this is the best available until Krassy can supply touch up paint in small bottles

regards, Marty, KA7GKN

1396. RE: [acom-list] acom touch up paint

From: B Marton
Topic: 1395 Message: 1396

Is Krassy planning on having paint available? If not, I might suggest
you take the RCU to a good automotive paint shop and have them computer
match it. They can come very close. I did this with Collins cabinet
and trim ring parts, and then I added other tints until I got it dead
nuts. I then added in a special flattening agent to dull the finish to
the proper semi-gloss and the results are cabinets that look better than
the originals, at least 35 year old originals. They probably looked
this good when the were sold new. I have painted several S line rigs
and the finished cabinets look great in the line up next to my other
'mint' condition rigs.

"normal" RS-232C should drive 50 feet of cable. It's all a function of
the capacitive effect and what it does to the edges. Larger diameter
cable will help.

Of course, you'll run into the cable becoming more resonant at some
operating frequency.

You could buy a pair of RS-232C to RS422 convertors (B&B electronics) and
run the signaling as a diff. pair. You'll get more distance, and somewhat
less RF problems.

Another option would be to convert to fiber.

K5NA used to sell fiber optic / serial adapters for CT networking use. I would think they would work here too - no?

Depending on the RS232 cards, drivers, you can get amazing length.

I was able to run 800 Meters on 18 gauge wire at 4800 baud. Your mileage
may vary. (This was NOT for an amp installation)

Just test it and see if it works.

1402. RS-232 Cable extension

Yahoo group: acom-list (1999 — 2009)
Date: 2005-04-28 14:03:28 UTC
From: Hal Kennedy
Topic: 1402 Message: 1402

Thanks to all for the great info. I didn't realize Acom sold an extender- I expect its pretty standard serial cable.

Ill be running a few checks i the next few weeks and report what I find. Its encouraging to hear there are LM393s on the ends - which is good practice and should help a lot. Ferrite beads might help any pick up/resonance issues.

Thanks again.

1406. Acom 1010

Yahoo group: acom-list (1999 — 2009)
Date: 2005-05-03 21:57:38 UTC
From: Charlie, W0YG
Topic: 1162 Message: 1406

Does anyone yet have the new Acom 1010 and the older Acom 1000? If so, can you provide some comparisons for me please. The 1010 seems to be a "traveling" amplifier as opposed to the 1000 which can travel but is right at the max weight allowable on an airplane. Since I hear the airlines are lowering the max weight from 70 to 50 pounds, perhaps the 1010 is the way to go for a portable amplifier.

I have compared the specifications between the two and since I own a 1000, I would like input from a 1010 owner.

Thanks and 73,

Charlie, W0YG..>>

1407. Re: VHF ? - ACOM1000 on 4m

Yahoo group: acom-list (1999 — 2009)
Date: 2005-05-11 11:34:41 UTC
From: Uffe Lindhardt
Topic: 1404 Message: 1407

I tried to tune the ACOM1000 on 4m with low power. Both capacitors landed in minimum position, and the gain was in the order of 0.2dB.

If you want to use the amplifier on 4m, I think the first thing to try
is to disconnect the 100MHz harmonic trap.

I am not sure, that this will be enough, so probably you would need to
reduce the size of one or both the coils aswell, to get resonance. If it will all result in a proper loading of the tube is also an open question.

I tried to do some simulations, but it did not lead to much, as it is difficult to determine the reactance values of the different components. I think a mix of simulation & practical testing is what is
needed.

The fact remains, that the tube will work fine at 70MHz, and that the input circuit is broadband resistive, so only the output PI-L circuit has to be adapted. Let us know, what you achieve.

From: Will Angenent
Topic: 1408 Message: 1408

Acom America has donated one of their new suitcase amplifiers (value $2340US) to be raffled off by WRTC 2006 fundraising committee. The proceeds will go to the WRTC 2006 general fund. Raffle chances will be sold for $10US apiece at WRTC fundraising locations throughout Dayton. The drawing for the amplifier will take place at the Contest Dinner on Saturday night in the Van Cleve Ballroom at the Crowne Plaza Hotel.

Dear WRTC 2006 friends:

By special courtesy of our friends from ACOM we are going to have a RAFFLE organized and coordinated by K1ZM (Jeff) and K1LZ (Krassy) during Dayton Vention , one week from now.
Please look for our WRTC2006 Team in ARENA and Crowne Plaza Hotel.
Take a look on the equipment. The specs on ACOM WEB PAGE http://www.hfpower.com/
Good luck
Oms PY5EG

1412. FW: [CQ-Contest] WRTC Acom 1010 Amp and WRTC Trip Package Raffle - fornon-Dayton Attendees

Yahoo group: acom-list (1999 — 2009)
Date: 2005-05-17 18:31:52 UTC
From: Gerry Hull
Topic: 1412 Message: 1412

Here's what you need:

Subject: [CQ-Contest] WRTC Acom 1010 Amp and WRTC Trip Package Raffle - fornon-Dayton Attendees

Gang

Just in case you missed it and are not attending Dayton, if you would like to take a chance on the FREE TRIP to WRTC 2006 in Brazil travel package

OR

If you want to take a chance on the ACOM 1010 suitcase type amplifier that has been donated by ACOM

Here's how to do it:

1) Chances are $10 per chance
2) Payment can ONLY be effected via PAYPAL to K1ZM@...
3) PLEASE be sure to give me within the text of the paypal transfer message:

a) Your CALLSIGN
b) Tell me which raffle your payment is for

I have to close this off by MIDNIGHT sharp on Wed May 18th, 2005 as I depart in the wee hours myself on the 19th for Dayton.

Interest so far is strong from here in the US and overseas. If you want to try your luck, go for it.

Thanks to all who have supported WRTC 2006.

Careful! I don't know about the Svetlana tubes, but some tubes are sensitive to element sag when mounting horizontally instead of the normal vertical orientation. This leads to filament or cathode shorting to the control grid. may not be a problem here, but check it out before you do any damage.

I believe the sag issue is mostly having to do with tubes such as 811a's, the ceramic tubes are very stout, the cooling fins are welded together and if you ever get them hot enough to glow, you have more problems than sag going on.

Check with Krassy at Acom and I think you'll hear from him that this should not be an issue. It's only my opinion, but ask the experts.

1420. Sideways?

Yahoo group: acom-list (1999 — 2009)
Date: 2005-05-23 15:59:29 UTC
From: Hal Kennedy
Topic: 1420 Message: 1420

From the Svetlana data sheet for the GU-74B (4CX-800A):

"Operating position: ANY"

See:

http://www.rfparts.com/GU84B.html

Being rated for "any position" however should not be viewed as meaning the tube's operating position can be changed once it has been placed in service - which is an entirely different and much more difficult spec to design the tube for. Unless the tube's filament supports have been designed expressly for the ability to change operating position after the tube has been operated, you can almost count on an open filament if you try it. The good news is that most if not all of the GU-74Bs on the market are the militarized/ruggedized ones and "should be" okay for position changes after being placed in service.

Here is the issue:

Filaments sag in all power tubes (including those rated for "any position") as well in ordinary things such as light bulbs.

When a filament is brought up to operation (white hot) the filament becomes soft, sags a little due to gravity and takes a permanent set mechanically. If you then change the operating position of the tube the filament will take a new mechanical set. Do this very many times and you will have a broken filament. "Very many times" can be as little as once. This phenomena is easy to see and demonstrate in a horizontally mounted bayonet style pilot lamp - like a #47. Take out one that's been operating fine, turn it 180 degrees, put it back in and in no time it will be dead. If you think of the two filament support posts in the #47, the filament was sagging in an arch shape 'down' between them. When you flipped the bulb 'upside down' the filament was arched up between the support posts until you turned it on, at which point the filament got soft, and gravity pulled the filament from arched up to arched down - they usually break in the first attempt.

Since the GU-74Bs are militarized/ruggedized, I would, with a little trepidation, turn my Acoms on their sides. But I would be leery of trying to operate them sometimes vertical and sometimes horizontal; or worst of all sometimes on their left side and sometimes on their right side without keeping spare tubes handy!

73,
Hal
N4GG

Subject: Re: Amp Sideways?

Careful! I don't know about the Svetlana tubes, but some tubes are
sensitive to element sag when mounting horizontally instead of the
normal vertical orientation. This leads to filament or cathode
shorting to the control grid. may not be a problem here, but check it
out before you do any damage.

Subject: RE: Amp Sideways?

I believe the sag issue is mostly having to do with tubes such as 811a's, the ceramic tubes are very stout, the cooling fins are welded together and if you ever get them hot enough to glow, you have more problems than sag going on.

Check with Krassy at Acom and I think you'll hear from him that this should not be an issue. It's only my opinion, but ask the experts.

I dont think there is a sag issue with the 800s as they were made for
military use in all kinds of environments, planes, tanks, etc. Still better
to check with the experts, Jim K4JAF

1421. just a reminder to keep your amp running 100%

Yahoo group: acom-list (1999 — 2009)
Date: 2005-05-28 14:50:52 UTC
From: shapiro_martin
Topic: 1421 Message: 1421

I have almost 3000 hours on my 2000A and I want to pass along these reminders:

1. check your rear cooling foam filter and wash off the dust
2. check to ensure all connections are tight and in good shape
3. verify your supply line voltage has not changed ...with this thought I also stongly suggest you purchase an ICE model 338 inline protector for delicate equipment. This is rated at 240v, 25a 1 outlet..and ground it per the enclosed instructions.

We protect our 120vac stuff with surge protection etc. but often the amp is overlooked. with lightning and storms a power surge is not uncommon. The cost of the ICE-338 is pennies compared to the expense of repairing the amp.
4. Dust off the tube chimneys and dust under the amp too.

A while back I wrote a post about touch up paint. I can say that the color is indeed very close, and if I'm not looking for the exact spot I painted, the touch up is almost invisible.

Living in Glendale Arizona, it is very dusty here. I installed a cover over the tube chimneys to reduce dust build up. I use one square of toilet paper per chimney. With the amp off the paper covers the chimney holes. with the amp on the exhaust air is strong enough to lift the toilet paper and allow full air flow.

regards, Marty KA7GKN

One thing I do for dust prevention is I put a piece of paper over the
two tube exhausts. If I forget to remove it before I turn the amp
on, it just gets blown off on its own.

One better. Make a flap like you see on diesel exhaust pipes.

Cut a rectangular piece of paper with long tabs on one side.
Attach the ears to the cabinet case with the plastic removable
adhesive. Voila. Opens with air flow and shuts with none.

You may have to fiddle with the width and length of tabs to get it
just right.

From: Barry
Topic: 1424 Message: 1424

Hi all,
Just wanted to let you know that Arnie, W7BIA@..., will be
handling the list management chores for the next few weeks.
Fortunately, this is a very well-behaved list, so all that's pretty
much involved is approving new members and weeding out the spammers
that try to sign up. If anything does come up, please contact Arnie.

I'll be heading to Z3-land for HST2005 (IARU High Speed Telegraphy
Championship), then to SV for the XYL's part of the trip :.) K1ZZ
tells me I'm the first serious CW op from the USA to participate. It
should be interesting and fun...

I don't know if HST scores will be posted to the Internet while it's
going on, but feel free to cheer me on :.)
Info at http://www.hst2005.com.mk/En/home.htm

Andy,

according to info given by ARRL it was not Krassy who's got his leg hurt.

CY9SS DXpedition on the air after rough landing
Source: ARRL - Date: 2005-06-10
The Daily DX relays a report from Robby Robertson, VY2SS, that the CY9SS StPaul Island DXpedition crew had a very rough landing this week. While coming ashore, the team lost a generator and three tower sections, and the landing craft?s captain hurt his leg. High wind and rain also hampered efforts to set up camp, but CY9SS has been up and running since early on June 8 on 80, 40 and 20 meter SSB (listening up). The DXpedition, scheduled to continue until July 7, hoped to be active on all bands by June 9. Logs will be posted to the Internet. A second wave of CY9SS operators is currently working its way north. CY9SS plans 6-meter operation. Listen on or about 50.103 MHz. QSL CY9SS via VY2SS, 57 Tranquility Ln, Bloomfield, PEI C0B 1E0 CANADA

From the Daily DX...KR N6RCE

I know many of you have been wondering what happened to CY9SS. VY2RU, Ken McCormick, tells The Daily DX the CY9SS DXpedition temporarily went QRT yesterday just prior to 1800Z. As you all will recall they had a tuff landing losing several sections of tower and a generator in the ocean. The weather also has not been very kind. Yesterday one of the team members was air lifted off the island and taken to a hospital in Nova Scotia. Around 2130Z yesterday K1LZ, Krassy Petkov, broke a leg. The helicopter crew, paramedics, Krassy and KY1V, David, left the island via a Canadian Search and Rescue helicopter around 0015Z today. KY1V, David, is OK he went along with Krassy to help out. On top of all the other things that have happened, last night a major storm with lightning came through. This too kept the CY9SS team off the air last night. The CY9SS crew is now down to four operators and will be back on the air as soon as they can manage. In fact as of this time (1130Z) CY9SS is QRV on 6 meters on 50103. Tuesday morning, June 15th, another five operators are expected on the island, weather permitting. Despite the weather on the island the first three days of operation of CY9SS the team will continue until about July 7th.

Bernie McClenny, W3UR

Subject: [CQ-Contest] Update on Krassy Petkov - K1LZ

Guys

I just spoke to Krassy Petkov's wife about his condition and Krassimira gave me the following update as of mid afternoon today. They operated on him last night and did surgical repairs to his left leg around the hip. Apparenty some metal parts were involved and Krassy is in ALOT of pain. Yet, the doctors are optimistic about his recovery.

At the moment, not only is his left leg broken but the right one is severely bruised and Krassy is basically immobile - he cannot move at all. There is no paralysis - just some time needed to recover from his injuries I guess.

He is in the Cape Breton Regional Hospital in Sydney, NS - and as far as I know, he has no phone at this time. I called the main patient number and a nurse went and found Krassimira so she could come to the phone and talk with me.

That's the latest on his condition - please keep this big guy in your prayers - he has alot to go through from this fall before things get back to normal.

Hey Krassy,

If you see this, I hope the hell you are doing OK. I won't invite you to climb the two towers this summer to install the wire antenna we talked about. I'll just have to take care of it myself! Anyway, get that leg fixed up, will you?

Hi Mel,

I visited with Krassy yesterday. He is back in Massachusetts, but not quite home yet. He'll be in a local hospital for a couple of days. When he's got his physical therapy and home care situation sorted out, I think he'll be heading home. He's in good spirits and on the mend now.

1436. New Acom 1010 amplifier

Yahoo group: acom-list (1999 — 2009)
Date: 2005-06-24 23:36:08 UTC
From: Charlie, W0YG
Topic: 1158 Message: 1436

Just wanted the group to know I have been testing the new Acom 1010 amplifier, an excellent small, portable excellent Dxpedition amplifier. It has performed flawlessly for me to date, three weeks operating time. I plan on taking this with me on my next trip out as my primary amp. It easily does 500W out and can do 700W provided you don't mind looking at a red LED. The folks at Acom tell me to run it at 800W out but I haven't had the need or the desire to go there yet.

Tuning is quite easy, especially with Acom's mething of showing you which way to turn the loading cap. There is not the same feature the Acom 1000 has of adding in the drive attenuator which would be nice, I have to admit.

All in all, Acom makes quality gear and this 1010 is no exception. If you need a nice portable amplifier, I highly recommend the 1010 as you won't be disappointed.

Just my two cents worth.

Charlie,

It really irks me that ACOM doesn't post the prices of their gear.

I wonder if you can tell me the price?

Brian:

The list price is $2340.00 as I recall. They did have a Dayton special though but not sure if it is still on.

1440. Acom 1000 - Fan running too fast...

Yahoo group: acom-list (1999 — 2009)
Date: 2005-06-26 22:19:46 UTC
From: Mark Simpson
Topic: 1440 Message: 1440

Hi,

I have owned an Acom 1000 for quite a while now, and I am very pleased with it.

Recently I have started to experience a problem (well it's more annoying than a problem really)...

Normally when you switch the amp on the fan comes on at maximum speed for a second or two then slows down until it is needed (it is designed to do this)... But my fan seems to remain at a high speed. The valve is not hot because I have not transmitted, and the temperature on the display is normal. I have checked all vents and other areas for build up of dust etc...

Has anyone else experienced this? It's not really a problem, but when you are used to the amplifier being very quiet it's annoying.

Mark, MM0MSS

1441. NOS 4CX800A tubes from reputable ebay sources

Yahoo group: acom-list (1999 — 2009)
Date: 2005-06-29 19:26:42 UTC
From: stevehurstg8lik2003
Topic: 1441 Message: 1441

I have been stocking up on 4CX800A/GU74B NOS tubes from a variety of 'mainstream' sources on ebay as a long term insurance policy. Worried about being stuck in 5 or 10 years with two great amps but maybe OTT tube replacement costs. I have not actually tried any in my Acom 1000's as its a bit of hassle but would love to hear if others have found them to be OK. The appearance varies quite a bit...some have slightly mucky purple ceramic, others appear to have been given the once over with a wire brush, sincerely hope none of them are pulls but just normal factory variations/storage artefacts.
Any comments/experiences and issues during replacement will be appreciated.

1442. Acom 1010 amplifier-first impressions

Yahoo group: acom-list (1999 — 2009)
Date: 2005-07-10 12:21:24 UTC
From: Charlie, W0YG
Topic: 1442 Message: 1442

I bought the Acom 1010 amplifier as a result of my experiences with my Acom 1000. I travel quite a bit and even though the Acom 1000 is able to be checked on an airline, perhaps some day, especially in view of some airlines lowering their baggage limits, the 1000 will be over the limit. This is where the 1010 in my opinion come into play.

I have used it now about a month. Its operation is as easy as the Acom 1000. Tuning is a snap, especially with Acoms procedure as it mimics the 1000 scheme. Output is 600 watts all day long, maybe 700 if you get excited and at the top end, 800 watts but not for long as fault LEDs start to glow yellow! RTTY requires a reduction in power to 500 watts out.

This amp also tolerates SWR very well, being able to handle up to 3:1 just like the 1000. That makes this highly desirable for portable operation as it mitigates/eliminates the need for a tuner.

Also a consideration is the 1010's ability to travel as checked luggage without damage or being shaken to pieces. A good protective case, like a Pelican case with what is called 2# foam, is a requirement. I use the 1620 Pelican case with a custom cutout that does not touch any knobs or connectors on the backplane. I had the foam cut to overall dimensions then cut troughs in the foam so the knobs or connectors would not touch. I did this with an electric carving knife.

Krassy and Will (in the States) provide excellent service but I too recommend you call if you need a timely answer. I understand they get literally hundreds of e-mails which makes a quick answer a bit hard.

Acom amps are like Eveready batteries. They keep going, keep going, keep going, keep going.....

Your MMV.

Hello Charlie,

Please let me know if you are considering selling your ACOM 1000 - there are some overseas 6m operators looking for a kw, and the ACOM 1000 has worked quite well for EME on that band. Hopefully the introduction of the new 1010 will free up a few of the 1000 models to be available for this use ;-) MNI TNX and 73, Lance

From: shapiro_martin
Topic: 1444 Message: 1444

Well gang it's a mild 116 here in Glendale Az. I decided it's time to remind you to do some preventive maintenance on your ACOM amps! remove the rear foam filter and wash off the dust build up. Allow it to dry, check all connections to ensure they are still tight, and dust the top cover.

Be sure you also have an ICE 338 240VAC 25Amp in line protector for delicate equipment!

You have a surge protector for your computer...Well the 240volt line requires surge protection too!!!

Here in Arizona we experience many power hic-cups and it's cheaper to do something preventive than boxing up the monster and sending it back becuse you fried the power supply!!!!

I am very happy with my Acom 2000A

Regards, Marty KA7GKN

Frank

Take an ohm meter and measure it. Very simple to do and no risk of damage to anything.

First, measure the open circuit voltage on the keying line. Do this without the radio attached. Make sure this is less than 12VDC.

Then put your ohm meter in a current setting and then put both leads on the keying line (without the radio). The amp will go into transmit (that is OK) and you can measure the current that the A1000 draws in transmit. Again, this needs to be less than 10mA.

My guess is that you'll be OK. I'll measure mine later tonight if I get a chance.

Frank:

Acom's specs say:

The electrical specifications of the amplifier's KEY-IN input are:

- switching voltage (open circuit) - 15V max, positive to ground;
- switching current (closed circuit) - 15mA max;
- voltage drop or resistance of the control output @ 15mA (closed circuit) - 1.5V/250 Ohm max.

Hi,
Having just got the TS480HX I thought I would try it with my Acom 1000. Just using the relay output though, yes you can hear the relay of the rig which is all but inaudible on the amp.However when the 2 fans come on on the 480 they make more noise than the Acom. That said it seems a good combination and nice to be able to set the drive power to the nearest 5W and there does not seem to be an issue with power overshoots. Seems a cracking combination! Good luck!

> Hi,

Hi Steve!
Thanks for the feedback, yep the 480 and the acom 1000 is a great combination. Try setting up your pf button as "tx tune" I've mine set so that when pushed it will transmit 20w of rf - makes tuning the acom a doddle.

I am about to install a 2000A outboard optional fan but after testing it with a 24vdc supply I found it moves a lot of air but at the expense of more noise than I want to hear when the fan is not needed. Does this fan just have one speed (full on) or is the speed controlled by the 2000A and will not run till "needed" or at some slower speed to minimize the noise?
Thanks
Mel, K0PFX

Hello Mel,

What I know is that this fan has only one speed.

I suggest to install a microswitch at the rear panel of the Acom 2000A. With this little switch you are able to switch the fan on, only when you will need it.

There are very different types of fan's. Perhaps you will find a "low-noise" fan, e.g. from PAPST.

Hans,
Thanks for info. In the archives, I did find installation info but I could not determine if the fan actually changed speed. I believe it is under "some" control. One message said the fan did not turn on during the 3 minute warm up of tubes. :-) Yes, I thought about adding small switch. I may have to do that.
Thank you for reply.

I'm wondering why a fan at all. The chief problem here had been removal of heat from the shack-- not heat from that amp. That was in RTTY contesting operation at 1.5kW output. Aux fan never needed. Fan for the shack was needed since temps could get up to 90F in these circumstances!

I was told this was the case by Krasy when I bought the amp. It turned out to be true.

Turning the fan off doesn't seem like a good solution since it blocks the cooling inlet.

If your amp is overheating, I suggest you find out why. Perhaps a good cleaning is in order. Alternatively, how much power are you running.

Hi Brian,
Well, perhaps you are correct. I run a lot of digital voice which has a very high crest factor (preak-to-RMS power is high) and I found my 1000 really heating up with out a fan. Is it true then, that this fan does run constantly at full speed? I've not been able to determine that, yet. This is a new amp, I have not even installed the transformer. To install the fan later, I'll have to lug it back to the work bench and remove the transformer to gain access to the small PCB. I am surprised that ACOM didn't spend a few more cents and install a connector there so the fan could be install without removing the transformer. :-(The other alternative is to find a slower rpm fan. I was just hoping it was under control and changed speed dependent upon cooling requirements, but guess not. I ran 250 watts with the 1000, I would like to run about 500 with 2000a (peaks will hit several times that) while maintaining minumum distrotion.
Thanks for your comments.
Mel, K0PFX

1457. ACOM tools serial interface

Yahoo group: acom-list (1999 — 2009)
Date: 2005-08-29 23:50:47 UTC
From: Mel Whitten
Topic: 1457 Message: 1457

I am attempting to connect a com port to the ACOM 2000A amp but have found it has a DTE 9 pin sub (male) instead of a DCE (female) pins. A "standard" RS232C 9 pin serial cable is not compatible since the PC requires the DTE (male) pin connector. Does this same sex on both mean I should treat the AMP like it is a printer or use a null-modem configuration? Or.. is the pin swapping done within the amp and I just need a straight thru cable with male 9 pin subs on both ends? I don't have the maintenace manual info, I suppose that would give this info.

tnx,

Mel, K0PFX

From: Hans Remeeus
Topic: 1457 Message: 1458

Hello Mel,

Not like a printer cable, but like a NULL MODEM cable.

This is the way to do it:

female CANNON-DB9 female CANNON-DB9
(ACOM2000A) (COM1 - PC)
nr. 2 <-----> nr. 3
nr. 3 <-----> nr. 2
nr. 5 <-----> nr. 5
metal case metal case

In addition, please remove any extra connections if present on other contacts. Only contacts 2, 3, and 5 should be connected. You should know that there is a +/-18VDC/50mA supply voltage available on contacts 1 and 9. It could be used by any external apparatus if needed but it should not be wired to the computer.

If your computer uses a DB-25 serial connector, please look at the READMEacom.txt file, p.6 which is contained in the attached zip. You may try also the ACOM.exe DOS application which is especially suitable to control antenna tunings with YAESU FT1000 or FT990 transceivers.

It works fine with me in this way I did it.

Good luck!

Hi Frank,

On 6 mtr I tune my Acom with "Tune-knob" on the "30" and the "Load-knob" on the "24" position. In your case is it possebly not the same position. You have to tune much more carefully than on the lower HF-bands course the small bandwidth. Mentaining to think about to switch the Amp on 50 Mhz, will not be necessary.

My Acom 1000 is working great on 6 mtr.

Just spotted the news from Vine Antenna Products here in the UK (and the supplier of my excellent Acom 1000A) that these VHF and UHF versions are under development at Acom.
No details available so can only guess on what may be planned...but the 4CX800A is good to 250Mhz for a 1KW output. As for 70CM we shall have to see!!! Can I guess at a GS35B triode? Probably completely wrong but time will tell!

I have an ACOM 1000 and I am interested in upgrading to the ACOM 2000a.
So, I need to sell this amplifier.

If there is a mark on this amplifier, I have not been able to find
it. It looks and operates as new. I have a spare final tube that I
can include.

I am a DXer, not a contester. It has had little use, mostly CW on 40
meters, non-smoking environment. It has been backup to an Alpha 87a -
which I am also selling after I get the ACOM 2000a.

It can be seen/operated in Yuma, AZ.

While ordering my ACOM 2000a, I said I wanted aux fan. Krassy inquited as to why, and I said I always like all the "ounce of prevention" I can get. He said, for the health of the amplifier, do not use the aux fan!

His reason is that after 2 years, the additional dust that the fan brings in causes coils to be coated with a kind of patina. Things just stay cleaner without the fan! And, with Acom's 4 year warranty, how can I argue with that!

He says heat is just not a problem with the amplifier -- it can run hot with no difficulty.

All this is somewhat counter-intuitive to me. Your comments?

Ken K5WK

1468. acom 2000a and aux fan

While ordering my Acom 2000a, I told Krassy I wanted the aux fan. He said "for the health of the amplifier, do not put the aux fan on it."

He said the fan results in more dust being sucked inside, and after a couple of years, it amalgrams with the coils, and you just do not have as clean an environment as you would have without the fan.

Mentioning RTTY, etc. Krassy says heat is just not a problem for the amplifier - dust is more of an exposure. Since ACOM is supplying the 4 year warranty, how can I argue with that?

This is all a bit counter-intuitive to me. Comments?

Krassy knows what he's talking about.

The amp is spec'ed out very conservatively, and protected very well.

Mine has been tossed around by baggage handlers between Antigua and Dallas 4 times for CQWW SSB operations and has been used in every major contest over the last 6 years or so back here in multi-ops at AA5NT - even on rtty.

No extra fan and it works fine.

73,

Bob W5OV

He said the fan results in more dust being sucked inside, and after a couple of years, it amalgrams with the coils, and you just do not have as clean an environment as you would have without the fan.

Mentioning RTTY, etc. Krassy says heat is just not a problem for the amplifier - dust is more of an exposure. Since ACOM is supplying the 4 year warranty, how can I argue with that?

This is all a bit counter-intuitive to me. Comments?

I have the extra fan and it has a filter on it. I've had no
problems.

Which then begs the question: "Under what circumstances is the fan recommended?" It's included as an option by Acom for a reason. If the amp is more than capable of running without it, including hot environmental conditions, then what was the rationale for including it into the amp design as an option in some instances?

Maybe for people like me who think heat is the reason for failures, and feel safer with it. Who is right? Again, THEY have to stand up to the warranty, and if it were a big deal, I think they would LOVE for me to put it on the amp.

So maybe dust is the root of all evils rather than heat? Especially if the heat problem is mitigated by shutting down the amp.

Another way of looking at it..... They can measure the heat and keep it inbounds. But they can not measure the dust.

From: N6KI Dennis
Topic: 1467 Message: 1476

I noticed that the tube temp in the Measurement Display for Front and rear tubes dropped almost 20 Deg C after installing Aux fan.

This would be in CW mode in a contestlike I did CQP this past weekend running 1500W out (key-down)

I would always take readings during heavy run times with code
speed from 28 to 32 WPM

I can't see how runningthe tubes 20 Deg hotter is going to make them last longer but I am not an expert in Cer-Met tube technology.

Yes, it is a good idea to clean or change out the fan filter
annually at minimum and ssooner if you are in a real dusty environment!

Iam sure that if the dan got clogged, you would see a temp rise
higher than 75 Deg.

My typical temp readingwith fan in heavy run mode is approx 52 to 55 Deg C (20 Deg higher without fan....What's in your wallet ?)

1477. 2000A Aux Fan

Yahoo group: acom-list (1999 — 2009)
Date: 2005-10-04 12:01:39 UTC
From: Hal Kennedy
Topic: 1477 Message: 1477

Bought one 2000A new - Wil tried hard to talk me out of the aux fan, but I insisted and got it. Installed it myself. It has never come on. I asked about the trip point - I was told its set in software at either 80 or 90 deg C of tube exit air temp (can't remember which), and I never get above about 75 deg C here so the fan just sits there and restricts the incoming air slightly. Next time I take the amp cover off I am going to remove the fan; plan B would be to wire it so it is always on (like the aux fan in my Alpha 99).

I asked if there was a way to reprogram the software and lower the "on temp" and was told no. My second 2000A runs slightly cooler - it has no aux fan and I'm convinced it's because it doesn't have the aux fan adding restriction.

Tube temp seems to be a strong function of tune-up. When properly tuned, my 2000As need 55W of drive for 1500W out, and the tubes are typically 60 deg C during heavy CQ on CW ands SSB, and around 75-80 deg C on RTTY. When not tuned properly, you can have 1500W out for 70 or 80 watts of drive and the tubes run a lot hotter. If you want to run your amp(s) this way - the aux fan might be a good idea. Or, if you are in a really hot environment and/or running on 50 Hz, the aux fan might be useful, otherwise it is just getting in the way.

Just another viewpoint.

I have the auxiliary fan on my 2000A and I found that the amplifier will run 20 -30 degrees cooler, than when I did not have the fan in place. I don't feel that dust is a problem. You just need to clean the filter once and a while and not every 5 years when there is a problem. There is almost no noise from the auxiliary fan and I feel that for the components to be 20 - 30 degrees cooler is better for the amplifier all the way around.

I don't think there's any argument that cooler is not better.

The point is that your amplifier is not "at risk" by not having the auxiliary fan.

1480. cooler is better?

Yahoo group: acom-list (1999 — 2009)
Date: 2005-10-04 19:37:34 UTC
From: pawnpushing
Topic: 1480 Message: 1480

Well, there is some reason for the 150 second warm up period.

There is obviously some range of normal temperatures that must be attained, just like our automobiles. Otherwise this would be an instant on amplifier.

We all came thru the 811a, 3-500z etc. era where we viewed the healthy pink on the plates. We knew too much pink was not good, and after about one failure, we paid a lot of attention to heat. Heat most certainly was our enemy -- the most prevelant consideration.

Now the problem of too much pink in the Acom 2000a is over. The temperature is monitored in a better way than we were ever able to do. Too much heat is bad. Too little heat is also bad. Putting the amplifier in a deepfreeze would not help. The point is that with or without aux fan, the tube is in its safe range, and it will not fail sooner due to heat -- the amplifier will shut down.

After consideration, I am not ordering the fan.

Keep in mind that putting the extra fan on the amp will probably
result in higher temperatures when the fan is not running.

The fan blocks some of the inlet area.

How much higher, I don't know.

With my 2000a the fan is always running. It comes on right after the amplifier comes out of warm up. How is it going to block the inlet area, if the fan is forcing cool air into the cabinet. I would rather clean the fan filter a few time a year and have the amplifier run 20 to 30 degrees cooler. I feel that the auxiliary fan helps to keep not only the tubes cooler but the other components, like the transformers and the electrolytic capacitors cooler also. It might be over kill to have the fan but I will be keeping my fan in place and working when I operate my 2000A.

I just use a good filter. I found excellent filter material at Home Depot used for central heating which
keeps the "dust/debris" out. I use this same material on 21 industrial pcs in a dusty, hot Ft Worth
ware house and they remain clean as a whistle inside. Yes, the filter causes additional back pressure
on the external fan but this should not be a real concern. It is necessary to check the filter 'monthly'
and replace it as required. Clean and cooler is better. :-)

Pat,

That is not how most people have the fan wired. Most wire it so it comes on only when temperature is above a setpoint.

Wired this way, when the fan is off, the fan blocks the air inlet. Most people quickly find out that the fan doesn't come on much. Thus, one had restricted the airflow most of the time.

Again, I don't know how much of an increased temperature this blockage adds. I do know it will increase the temperature.

To me the extra fan defeats one big advantage of the ACOM. That is that is a quiet amp. Why add the extra noise when the cooling isn't required?

I hooked up the supplied extra fan to a power source to hear how it sounded before installing. To me, it added an unacceptable level of additional noise. The fan was never installed. It was never needed either-- even during RTTY contests. (What I really needed was an additional exhaust fan for the shack! The temperature in the shack did sometimes get above 90F during RTTY contest weekends. This speaks quite well for the ability of the stock cooling system's ability to remove heat from the amp...)

Pat Twentythree wrote:
> With my 2000a the fan is always running. It comes on right after the amplifier comes out of warm up. How is it going to block the inlet area, if the fan is forcing cool air into the cabinet. I would rather clean the fan filter a few time a year and have the amplifier run 20 to 30 degrees cooler. I feel that the auxiliary fan helps to keep not only the tubes cooler but the other components, like the transformers and the electrolytic capacitors cooler also. It might be over kill to have the fan but I will be keeping my fan in place and working when I operate my 2000A.

From: Pat Twentythree
Topic: 1480 Message: 1487

Brian,

When I wired my fan into the 2000A, I didn't see any indication that I could set the fan to turn on and off with temperature. When I spoke to Will about it, he never made mention of any setting that could be adjusted to turn the fan on and off with a temperature setting. I guess, I must have missed something.

As for noise there is almost none, I have to put my ear just above the auxiliary fan to hear that it is even running. I must have received a different type of fan then the one you received.

As far as I am concerned, cooler is better.

My aux. fan runs all the time, and I was unaware of any other option,
too. IIRC, it was installed at the factory. I don't remember
installing it (but it's been a while, and I'm getting older, hi).

1489. Cooler is better

Yahoo group: acom-list (1999 — 2009)
Date: 2005-10-09 12:51:13 UTC
From: Hal Kennedy
Topic: 1489 Message: 1489

Interesting to find there seems to be two ways to wire the aux fan. I wired mine in - put the wires on the "fan +" and "fan -" solder pads. The fan never comes on. Checked the fan - its good. Checked with Will, he told me the set point is 80 or 90 degrees C, and set in software and can't be changed. I never get to 80 degrees C.

I have one 2000A without the aux fan and one with. The one with the aux fan that never runs, runs about 4 degrees C hotter than the one without. I attribute this to air flow blockage by the non-operating aux fan.

Electronics reliability studies over the years all have pointed up the fact that cooler is better - the data is compelling. A few degrees C however is not significant. There may be hot spots within the amp that could benefit from more cooling - but the 2000A seems to be very reliable from all reports.

The reason there is a 150 second warm-up period is because of the cold war - no pun intended. The US blocked the export or thorium related technology to the USSR - judging it a strategic technology. As a result, the Russians did not have thoriated tungsten filaments, and stuck instead with indirectly heated metal-oxide cathodes. This is what's in the Svetlana 4CX800A. Cathodes take time to heat up to a nice even dull-red temperature. If you let the tube emit before the cathode is evenly warmed up, the hottest spots on the cathode will emit all the electrons (current), and you can burn a hole in the cathode at those spots. The rest of the amp requires no warm-up, but the tubes need a good 150 seconds. Tube life may be extended by holding off transmitting another 30-60 seconds after the timed warm-up, assuming you are not chasing the country you need to make the honor roll - in which case 150 seconds seems like eternity. The Alpha 99 timer is 180 seconds.

80 deg C is 176 F, 90 deg C is 194 F. Thats pretty warm to the touch, and will heat up a closed room.

So, what about the US tubes made with indirect heated cathodes - 8874's as an example? I got to believe it is more than an exporting issue of thorium.

THE fan noise is negligable and almost undetectable.
If I understanding how you testd your fan for noise,
you hooled up the fan by itself and not to the amp
with the filter in place...had you put it into actual
operation you on the amp, you would see there is virtually
no noise when it runs constantly.

I'll take the 20 Deg drop and once a year cleaning....
over possible reduced life of whatever components
deteriorate due to heat over the upcoming years.

Sandy,

What fan did ACOM supply you with? Mine was a PAPST AN4214GM. It's
noise contribution is rated at 45dba which is pretty noisy.

BTW I'd be glad to sell the above fan for $20 shipped via USPS.

1494. Cooler is better

Yahoo group: acom-list (1999 — 2009)
Date: 2005-10-10 12:32:14 UTC
From: Hal Kennedy
Topic: 1489 Message: 1494

Regarding US tubes with cathodes - thoriated tungsten filaments require lots of current and are expensive to manufacture, and do not hold physical position well compared to cathodes; hence they are not universally used. The choice between filaments and cathodes is the result of a set of tradeoffs including physical robustness, cost, warm-up time, class of intended service, service life, etc. US makers can choose between thoriated filaments and cathodes, USSR makers could not in years past. They may have access to thoriated tungsten now - I don't know.

BTW: I like my SVET 4CX800s just like they are. Slow and ugly, yes - but cheap and otherwise quite robust.

1495. acomTOOLS question

Yahoo group: acom-list (1999 — 2009)
Date: 2005-10-10 16:33:14 UTC
From: Bill NY9H
Topic: 1480 Message: 1495

a new user has a question....

Is this an error???
it is being sent repeatedly into the exception report ...if not
filling up , certainly crowding the report,,,,,:::

EXCEPTION(ERROR)
ERROR:Source:newObjects.USPCACOMSerislProtocolPacket1,Incorrect
paremter firld size-this error is expected if you are using
paramString property,(line 60,chr24,conyext0)

Is this tying up bandwidth for no reason ??? pse help me to slightly
understand this ....

everything seems to work ok....

bill

Bill,
I don't know what the error means, but Acom Tools was written for
Win98. For me, it works fine on an old Win98 computer I have, but
won't work with my XP system.

I know Acom had some "miscommunications" with the guy (in LZ) that
wrote the program. It's a shame Acom has not updated their software
for current operating systems.

it (v 1.5beta) does work fine with the exception (excuse the pun)
of the exception report,,,""this error is expected if you are using
> paramString property,(line 60,chr24,conyext0) ""

if the error is expected, then i wonder how to fix the "string" or whatever,,,
so while expected i'd like to not have exception report full of
"expected" stuff...

maybe i'll be able to figure where line60 is....

at least this exercise has me learning about computers,,,,

From: Brian A
Topic: 1480 Message: 1499

Dennis,

I disagree. Bench testing is the way the dba is measured. They can't measure it in all possible configurations. It is the only reasonable way to compare fan to fan differences.

A quick search of the internet yielded the following reference to fan noise measurements:
http://www.keysida.com.cn/News/en/e_news_detail.asp?id=53

I quote from it:

"According to CNS8753 test standard, such as the diagram shows to placed the fan in to the room with background noise lower than 15dB, and put the microphone in front of the inhaling wind side of the fan with distance of one meter, and after measuring, through analyzing and systemizing the testing data by the computer, we can draw out the trend curve of Sound Pressure Level frequency."

What you are asking me to believe is that a fan which has a 45dba noise value in free space will decrease to something like 25 or 30 dba by simply mounting it on the back of an amp! Good trick-- reducing the noise a factor of 10-30.

I guess I'll have to take your word for it since I would not mount such a noise maker on the back of a quiet amp.

Topic: 1480 Message: 1500

Acom tools runs Ok on my AMD Athlon 64 using XP.
Have not had any faults/error messages.

I do not have the ACOM antenna switch so don't know
if program will function under XP with it.

Yes, program has not quite kept up with what could
be done. Geez, a little faster communication rate on the
serial line for starters. 1200 baud? 9600+ would give
much faster response. And 5 level baudot for
diagnostics? I guess there is/was a reason for these slower
speeds. No real complaints, it works, so maybe that is the answer. :-)

1502. ACOM Tools

Yahoo group: acom-list (1999 — 2009)
Date: 2005-10-11 12:06:59 UTC
From: Hal Kennedy
Topic: 1502 Message: 1502

Anyone been able to use ACOM tools or any other program to control a pair of 2000As from one computer? Running SO2R here, it would be really nice to have ACOM #1 follow radio 1 and ACOM #2 follow radio 2. Two instances of ACOM tools don't seem to co-exist well when running at the same time under one O/S.

Hello Hal,

I have two Acom 2000A's too and connected them to a laptop. I tried what you want, but I did'nt succeed.

With a normal computer A/B Dataswitch I can readout the two linears with one AcomTools on one laptop, without the need of restarting the AcomTools.

It's been a while since I confirmed it, but as I recall, the internal metering tracked pretty well with my Coaxial Dynamics meter.

You may need a higher range slug than with some other amps.

Jim,

I assume you know this. However, the forward power will not read
correctly unless SWR very close to 1:1. Higher SWR's give you higher
forward power.

In any case the power out = foward power - reflected power.

Compare the above power out to your standard and see how they agree.

1512. Re: [acom-list] information pse

Yahoo group: acom-list (1999 — 2009)
Date: 2005-10-15 20:36:09 UTC
From: Jim Cox
Topic: 1480 Message: 1512

No, it is still high. When you take forward power, less reflected, the amount seems very high.

If you take the voltage times current to get the input power the efficency is running about 85 percent when I think is too high. Jim

OK Jim, that is a good check.

On my ACOM2000 after a couple years, the metering resistors for the HV drifted. I was similarly getting an absurdly high efficiency.

Is the HV value within spec?

1514. Re: [acom-list] information pse

Yahoo group: acom-list (1999 — 2009)
Date: 2005-10-15 23:54:27 UTC
From: Jim Cox
Topic: 1480 Message: 1514

Yes, unfortunately Acom doesnt supply much detail in their manual of voltages, etc.
I assume from the simplified (and I mean simplified) schematic it looks like 2800 out of the HV power supply, this is right on the money, I think I show about 2825 VDC. Under full load I show about 2550 volts and with 55 watts drive about 530 ma of plate current which yields about 1350 watts input. I show a power output (FORWARD LESS REF) of about 1125 watts or an efficency of 83 percent which seems too high to me. Wonder what values others are showing on their Acom 1000s? Jim K4JAF

1515. Re: information pse - ACOM1000 output power reading

Yahoo group: acom-list (1999 — 2009)
Date: 2005-10-20 08:50:29 UTC
From: Uffe Lindhardt
Topic: 1480 Message: 1515

I can remember that this has been discussed before, but I cannot find the thread. The answer from ACOM was that the power reading was accurate, which it is definitely not, since it is too high, escpecially on 6mtrs.

One point made by ACOM though is that adjusting the power reading, will also affect the workings of the tuning aid, such that you will not be able to load the amplifier properly anymore. Maybe it is better to live with this minor crank.....

1516. unimpressed

Yahoo group: acom-list (1999 — 2009)
Date: 2005-10-25 14:15:16 UTC
From: pawnpushing
Topic: 1516 Message: 1516

The ACOM 2000a sure sounds like a great amplifier with a great warranty. But ...

So far I am not impressed by ACOM America. It seems to consist of a phone line, a part time telephone answering lady, and two people who do not return phone calls, and may not even be in the country.

The email stopped working some time ago. Now the lady who answers the phone isn't sure when anyone will be in.

I ordered the ACOM 2000a a month ago. I was told they would fill my order "next week", week two. When I called late in that week to get a tracking number, I was told that a new batch of amps was comming in the next week, week 3, about Wednesday, and they would be shipping our amps on Friday of that week --DEFINATELY in time for the contest. That Friday was last Friday. I would receive a tracking number by phone call.

Now its Tuesday of week 4. a few days before contest weekend. No phone call. I called twice yesterday to get my tracking number -- had a nice talk with the lady who answers the phone. Still no one has given me a return phone call to discuss the matter. I do not know the status. I am embarrased to call again. I would say the contest is out.

Maybe everyone is in Bulgaria?

I think Will saw my note, and called me. He said the amps just have not come in -- and he is sorry about that but can do nothing without amplifiers.
I feel better - just knowing not to make plans for the contest.

You will feel even better if you choose an amp-less category in the contest and have maximum fun with minimum power!

Same issues with purchase of 2000A, however I was informed last
Thur. (20 Oct.) that ACOM was waiting on customs clearance. If I had
not sold and shipped my prior amp (QRO 2500DX) it would not be a big
deal. However, with all the BIG GUNS in Northern Virginia area, I'll
never be able to compete this weekend.

Guess there is life other than ham radio.

Last year I almost got the 2000a,,,
I had much better luck this year when I called a few weeks ago,,,,,

even the emails, got answered,,,,,,,,,

Received the 2000a three days after ordering it....
several calls to Will were helpful..... some dumb stuff on my part,
but Will was available....

emails are NOT the best way , telephone worked out ok,.,,,,

just starting to set:autotune for each antenna...
QUITE THE FINE BOX....

bill

Bill,

Guess I had a chance to get that amp as they had ONE in stock, but by time xyl and I got together on spending all most $ 7000 on ham radio it was gone! Enjoy the amp., I'm sure mine will arrive one day, however I sure would like to be kept informed as to status. As I said they were expecting customs clearance last Friday, so may be it will be a short additional wait.

For some reason it seems my order was put on the back burner, and whoever made noise on the phone last got the amp. I must have called on the wrong day or at the wrong time and left messages rather than talking to decision makers. These conversations trumped my older order. One month is sure longer than three days.

I am not sweating it anymore. The time that I was aiming for has come and gone. I am looking around ...

I called ACOM on a Tuesday and spoke to Will. He told me that they had the 2000A in stock and the next day, I had the amplifier at my house. This happened about two months ago. No money up front, basically a verbal hand shake with a letter and after I had the amplifier, I sent ACOM a check. I have found the amplifier to work great and I am very happy with the service and the amplifier. Ken, you can look around and buy something else but you will still want a 2000A. I would just wait and get what you truly want.

While I am not making any implications of any kind toward ACOM, before making a high dollar purchase from any relatively low-volume vendor, condition the sale and terms of acceptance on immediate shipment at the time payment is rendered to the seller. Get it in writing and change their "boiler-plate" terms and conditions, if necessary.

If payment and a charge is required to place and hold an order, and you cannot cancel the order at any time prior to the shipment date without penalty -- turn around and run. Finally, if the reputation of the vendor is in question or you have reason to suspect they may file for creditor protection under what remains of the federal bankruptcy laws, place the payment in escrow with an escrow agent or attorney as trustee.

No up front charges were required or made.

Even the folks at Alfa want $3500 up front for their Alpha 9500 amp. Fifty of that is not refundable. ACOM is a lot easier to business with from that point of view.

I have had my 2000A for the better part of 2 to 3 years now. It has served me well, very well in fact even though I have very low hours on it. I picked mine up at Acom on a Saturday morning one day with Krassy waiting with coffee for my arrival. He gave me a full demonstration of the amp and instructed me on setting it up for full coverage transmit which it now does (FEMA/CAP frequencies required). After the deal he gave me a full tour of their operations here in the US which involved some rather interesting manufacturing contracts. We spent the entire Saturday hanging out and chatting.

Last year my amp failed. I was very concerned and called Krassy. I have to say it took me several days to reach someone at the shop, but it was due to the fact that they were so busy with other contracts which were non-ham related. I did get Krassy on the phone and he told me to run the amp down to them, which I did. Krassy and Will looked it over, and performed several diagnostic tests only to determine that the most likely culprit was a tube. He replaced the tube, realigned the amp and I was off and running. During the entire process the boys sent out for lunch and we had a grand old time.

Upon return to my QTH, I installed the amp and put it back into service only to notice that the temperature differential between the tubes was running 20 degrees. I called Krassy and he said the tubes are not well matched which we didn't look for while at his shop. Unfortunately we couldn't, the area was hit with a lightning strike right after we replaced the tube and the power went out for the balance of the day. Krassy said he'd come up to my QTH in Maine over the following weekend with a box of tubes and find a nice matching set. He brought in a half dozen tubes and we exchanged tubes until the parameters in amp matched perfectly. Again he realigned the voltages and the tubes run dead nuts in temperature now.

I know they seem to be difficult to get a hold of from time to time, but the service is super when you do connect. Krassy is behind the amp 100 percent in my opinion and I find them super easy to deal with. In fact Krassy told me when I bought the amp that if I didn't like it after taking it home, I could return if for a full refund. He said use it for a month, if you don't think it's the best amp you have ever used, bring it back. Well it's still here!

One other note of interest.a buddy of mine has an Alpha, I forget the model, but it's the monster one that runs three holes. He was in need of repair and Alpha was not easy to work with at all. He had terrible issues in terms of making contact with them and they kept the amp for a very long time to make the needed repairs.

Bruce,

Although you have the advantage of being within driving distance that many do not, I think that understanding the type of business that Acom is may help somewhat in diffusing the expectations that they should be otherwise.

Thanks & 73!

Bob Naumann - W5OV

I also had a repair done on an Alpha 87a. I switched from 30 meters to 20 meters and suddenly hit it with 200 watts of drive -- the one way to damage the 87a. I paid a total of around $1600 for that repair! There was no tube replacement, just other parts and LABOR. Included in the cost was the upgrade to alphamax -- but still it is hard for me to get the bad taste out of my mouth. That is my hesitation for not being interested in their new amplifier.

One other note of interest.a buddy of mine has an Alpha, I forget the model, but it's the monster one that runs three holes. He was in need of repair and Alpha was not easy to work with at all. He had terrible issues in terms of making contact with them and they kept the amp for a very long time to make the needed repairs.

From: Hans Remeeus
Topic: 1534 Message: 1535

Hello Ken,

I used the Alpha 87A for a couple of months and got a problem on 40 meters; no more power output. Something seemed to be wrong with the bandswitch.

I send a couple of e-mails to Alpha Power but hardly got a reply, just a few questions. The 87A was still under warranty. The only person who gave me a good service was Glenn.

After a while I swapped the 87A with an Acom 2000A. I did'nt regret this for a second. The Acom 2000A is ROCK SOLID! And the service from Acom Bulgaria is FANTASTIC!

Alpha perhaps has the name, but Acom by all means has the quality...

I have the same story. I stopped by their QTH.. Loved the Amp.

Asked Will if he would take Visa, he said no. I said I would be back in about 3 weeks with a check. He says, here, take this one and send me a bank draft when you get home.

Off in the rental car I go to Logan. Checked my carry on luggage and the Amp onto Air Canada back to Toronto. Paid the duty and had it on the air with a 6M opening within an hour of being home.

I'll keep my A1000.

1538. ACOM 2000A Purchase

Yahoo group: acom-list (1999 — 2009)
Date: 2005-10-27 16:28:54 UTC
From: lewischeek
Topic: 1538 Message: 1538

After having placed my order weeks ago, I find the best way to close the purchase is to place a phone call and ask to speak with Will or Krassy rather than sending email or leaving messages. I think with a two to three person operation it's easy to overlook responding to email and returning phone calls. If the product is not in stock, make it a point to call often checking status.

I found this out the hard way, if I had stayed on top of my order, I would be up and running and not doing a 11th hour rush late tomorrow afternoon.

Thanks Lew. I am going to call every two days to "check status". I was told he has three orders unfilled at the moment. I am sure which of the three he ships to first is his choice since orders were taken over the phone and probably not "time stamped".

Enjoy the contest.

1544. USR settings, 2000A

Yahoo group: acom-list (1999 — 2009)
Date: 2005-10-31 19:29:55 UTC
From: lewischeek
Topic: 1544 Message: 1544

I'm a bit confused on the number of "USR" settings per band segment.

The way I read it is that I can have up to 10 per segment, however how do I store then when I'm only using one ant. for auto adjustment?

Most of my antennas are cut for cw portion of bands, and the SWR (less than 3-1) is a bit higher on upper end of phone portion, requiring a retune for proper power output.

Received amp. on Friday and used during CQ WW Phone for S&P operation, sure for nice operation.

From: Eric Scace K3NA
Topic: 1543 Message: 1546

I put my Acom 2000A into a 19 inch rack. Weight distribution precludes using mounting tabs. One
could probably do it with slides. I just put a shelf between the front and rear rails and set the
amp on the shelf.

Note the requirement for vertical clearance above the tube vents. Anything above the amp in the
rack must allow for this clearance.

1552. Re: [acom-list] PA spare tubes ?

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-01 20:18:52 UTC
From: Ken Waites
Topic: 1547 Message: 1552

This was from a discussion with Alfa on why they went to a one tube final. They claim they looked at the 4cx800 pair, and looked at what it would cost for Eimac to manufacture them -- saying the Russian supply was limited. This was most likely just a bit of disparaging on their part. At the prices they want to charge, I can't imagine them using a tube without Eimac's name on it. Of course if they are not going to use them, then that means there are that many more still in the supply chain.

1554. Re: [acom-list] Power out 2000A

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-01 21:04:45 UTC
From: Hans Remeeus
Topic: 1545 Message: 1554

In our country the Acom 1000 costs around 2200 euro.

What is the price in the US?

I will sell my ACOM 2000A (manufactured 1999) for 2500 Euro plus shipping
charges ,if there are any takers after CQWW CW 2005.

Make yourself a Xmas present :-)

1558. 4CX800A/GU74B Tubes

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-03 00:18:05 UTC
From: k2qmf@juno.com
Topic: 1558 Message: 1558

Hello All,

I am looking at buying a pair of tubes
for my Acom 2000A amplifier.
It uses two 4CX800A/GU74B ceramic tubes.

Can anyone recommend a distributor for these tubes?
Also, do I need a "Matched Pair"?

Thanks for any suggestions...

73, Ted K2QMF

From: bmarton
Topic: 1558 Message: 1561

I would call Acom. Krassy sells the tubes and I do not agree about unmatched tubes. If the tubes are not matched, one will pull the current more than the other and you can readily see it by monitoring the temperatures. I had a poorly matched set in my amp and one tube was running a solid 20 degrees warmer than the other. In fact it was to the point of looking rather uncomfortable. I changed them out very quickly and got a very nicely matched set that now run dead nuts even in temps. The overall temperature of the finals is much lower too.

I have uploaded the ACOM1000 documentation, that I found previously
on the Web to the Files section. The doc is very complete with
schematics for every sub part, as well as PCB layout. Also the user
manual is included. The block diagram resolution is not that good
though.

From: pa7two
Topic: 1574 Message: 1574

Hi to all ACOM users!

Just bought a ACOM 1000 unit a day ago and testing along on the HAM bands. A few questions raised:

With the transformer taps set to 240 volts I got way too low power output (930 watt max), so first trials on a spinner dummyload gave me the following results:

House mains is 222/223 volt. Test frequency is 14MHz. Bird wattmeter, Revex wattmeter

230 volt taps:
2672 / 2704Volt (2288 when under load of 60 watts input),
50 watts in = 790 watts out
60 watts in = 957 watts out

Still too low according to ACOM manual specs, so having taps set to 220 volt, the following results were noticed:

220 volt taps:
2784 volt (no load),
50 watt in = 830 watts out
60 watts in = 1016 watts out
90 watts in = 1250 watts out

Much better results but.... when set to 220 volt, the AMP HV transformer HUMS so badly that I cannot use this setting..! So I had to set the taps back to 230 volt....

Can anyone tell me what I can expect from this amp when talking about the specifications as outlined in the manual? I mean, is 1000+ watts with 50 watts drive into a 50 ohm dummyload expected or a 'typical' value?? Please tell me your findings.

Looking forward to the replies,

73, de Kees - pa7two - m5two.

How good is the 220 volt circuit in terms of voltage drop on the primary side... You seem to have a lot of voltage drop on the secondary side of the xformer... See what your power input is according to the meter, efficency should be about 65 percent or so. You will note in the manual that it is rated for 1 kw out at about 60 watts input so your power seems to be ok.

Hi Jim,

Thanks for your reply.

When I moved into this new house, I created a three phases mains structure. Phase 1 is the one and only used for the shack (...25 amps...) Voltage drop must be minimal, as light bulb does not flicker whatsoever.

Problem is that when the 220 volt taps are used, the correct power values are present BUT the transformer HUMS so badly that I cannot and do not want to use the amp in that condition.

BTW, the 230 volt taps still gives a light hum but I can live with that...but with that setting, the amp does not meet specs as outlined in the manual...

Regards,

Kees

No, mine was on 60hz, but 50Hz should not be causing problem, just guessing, Perhaps, others will have answer.

I wouldnt think you should have that much hum at either voltage or 50 hz.
The xformer isnt going to be as efficent at 50 hz but shouldnt have that
much hum. Is it physically tightened down well?\
I dont notice any physical hum here at all at full power output, amp is very
very quiet.

I'll try later today to see if the bolds and nuts of the transformer
are tightened.

On the 230v taps there is still a very light hum present, but not as
bad as on te 220 taps.

Kees pa7two.

1582. Re: newbe Acom 1000

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-11 15:19:29 UTC
From: edctexas
Topic: 1574 Message: 1582

Typically there would be more hum and vibration noticeable on 50 Hz operation of any transformer. Normally one would expect that at higher excitation with more magnetizing current there would be more "hum". Selecting the 220 tap versus the 230 tap lowers the primary side magnetizing inductance which does two things. It first raises the effective tuurn ratio primary to secondary, and second causes more magnetizing current to flow.

The only things that should cause audible hum even when operating on 50 Hz are: loose mounting; loose laminations; or failed varnish impregnation. Given the construction of the transformer, I would guess that either the mounting is loose or the transformer maybe be defective. Give the factory a call and ask for an opinion.

Hi Ed,

thanks for the clear explanations. Yes, indeed, I'll contact Acom,
and I will keep you gents updated on the matter.

Checking the bolts and nuts of the transformer in the meantime.

Kind regards, 73, de Kees - pa7two - m5two.

1584. DC Input Measurement incorrect ??, ACOM 2000A

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-16 14:46:07 UTC
From: pawnpushing
Topic: 1584 Message: 1584

On my amp, this measurement is not correct.
With 1-2 watts drive it shows 1.12 KW DC input.
This produces about 50 watts output, small place current.
All other parameters appear correct. This is not a bother,
just causes me to scratch my head and wonder how accurate the
other measurements are.

Or maybe I do not understand what is being measured here.

Ken

Remember that the amp is hopefully a linear amp. At low/no RF drive the amp has an idling DC dissipation of Ipa (idle) * Vplate. I don't think that this should be 1kW but will be somewhere between 250 and 400 watts. With a small drive the Ipa will increase but the output won't be more than 12 dB above the input drive which in your example would be about 30W. This should add roughly 60-70 watts to the idling power.

If I understand the amplifier operation correctly, the ACOM amps not only need to be switched to TX via the "KEYIN" but also have detectable RF coming in to be biased up to the idle Ipa reading. I would doubt that the readout (via A/D to the LCD) is off by 500- 600 W worth of Ipa reading. You don't mention what yours reads. I'm at work and can't look at any of my amps to see what "normal" might be. I would guess that the accuracy of the A/D might be slightly less at low levels on any of the measured parameters, but no more than 5-7%.

So you might share what the Vplate and Ipa readings that occur under the 1-2 watts drive are with the list. Perhaps someone with access to their amp can share what they think "normal" for these parameters are.

Drive: 3 watts
DC-Input: 1.13 KW
Fwd Pwr: 100 Watts
Gain: 15 db
HV 2.56 KV
Plate current: .44 amps
Plate RF .48 KV

I think the main thing is that Plate RF and DC-Input are two different measurements. Plus we are measuring at the ends of the scale.
Needless to say, the measurement kinda jumps out at you.

1588. DC etc measurements ACOM 1000

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-16 17:40:05 UTC
From: DJ3IW Goetz
Topic: 1588 Message: 1588

Hi,

in my ACOM 1000 I read the following values for 3 watts drive:
Frequency 14088kHz, Drive 3 Watts, TUNE AND LOAD adjusted for
maximum output!!!!
Plate Volts under load: 2560 V
Plate current: 200 mA
Plate RF Peak: ~2500 V
DC Input: 510 W
Output Power: 225 W
If I tune the amp for "normal" output first and then reduce the
drive to 3 watts WITHOUT RETUNING I get these readings
PLate Volts under load: 2560 V
Plate current: 210 mA
Plate RF Peak: ~ 756 V
DC Input: 530 W
Output Power: 85 W

What I was trying to say before, perhaps alittle clumsily, is that you need to remove the idling current from your calculation. The amp will seems VERY inefficient at low power. Especially the ACOM amps as they have better distortion (slightly higher idle current than comparable amps). If you had no drive and could keep the bias at normal levels, you would see Ipa and some Vp for no power out. If my memory serves me, the ACOM quickly biases the tubes to cut off in the absence of drive. So you'd need to look quickly as you went to zero drive.

The amp when fully driven should be somewhere between 48 and 56% efficient (RTTY, CW or two-tone). But, only near the top rated output! At lower outputs, the efficiency will seem worse because of the idle current. Remember the amp is class AB.

The numbers look good to me except I really don't understand the plate RF voltage. This seems low for 450w but as I say I'm not sure I understand what that is really supposed to mean. Try a quick full blast reading and see if the numbers don't look better (not too long even though the ACOM can take it).

Ed, that makes sense.
I mistook what was being measured with DC-Input. Only later did I understand what was being measured. DC input instead to RF.
The 1kw jumped out at me with 3 w drive. At low power, one is running the electric meter pretty hard for the output. Best just stay with the exciter at full tilt than to power up the amp for a few watts more e.g. 30 meters with the 200 watt limitation.

I no longer have the Orion but am famiiar with its operation with linear amps. The keying loop prevents hot switching of the amplifier especially in QSK. The lead names are sort of misleading. The Key In is the PTT out of the radio. It switches the amp from idle to hot and switches the bypass relay around the amp to the feed positions. The amp is normally bypassed in idle so one can hear. In "hot" the amp output connects to the antenna and the amp rf in connects to the Orion.

The Key-out is sort of a don't put out RF or anti-key output to the rig. Another name might be TX inhibit. Its function is to prevent the rig from producing RF until the TR relay has completed the antenna transfer action. With the ACOM and the Orion, I would not think Keyout is really needed. The ACOM is fast QSK switching (alot faster than my old QSK Amp Supply LK-550). Still its insurance. If the ACOM detects a fault, key-out will prevent the Orion from outputting RF when keyed until the amp is bypassed (standby).

Hope this wordy dialog helps. I was confused when I first encounterd the key-out or keying loop. An possible alternative for rigs that don't have a TX inhibit (key-out input) input is to use something like the Microham MK keyer sequencer. It has a programmable Amp PTT output. When you use the MK winkey on CW the MK keys the AMP before keying the rig. You can have the MK "hang on " to the PA PTT (semi-breakin) or follow keying for QSK. Thats what I use with the ICOM 756PIII (Orion replacement). I'd probably have an Orion MkII if they had gotten around to that sooner, but Orion stories and bugs are yet another reflector. Good luck and happy CW

Thanks Ed.

It seems to me ACOM would show an error if it hot switched. Both ORION and ACOM say key2 it is likely not needed. Maybe only at very high QSK speeds since the dits get pretty short with higher speeds. The ORION is only guaranteed QSK thru 65 wpm - which does not cramp my game!

I have one of the devices that fit in the relay line, but unfortunately it is with my other rig at my other location. I may go ahead and put in the the second line and see if there is any notable change.

New software load for Orion coming out about Christmas, so there may be some change there.

I have also used the Orion with the Acom 1000 and no problems. I did use the QSK method of in and out signals but have used it the other way with only one keying line and worked fine. I don't run cw at over 25-30 wpm so maybe that helped. I use the acom 1000 now with the Pro II and no problems at all with only the one keying line. Loved the Orion receiver but the other problems turned me off on it, but again my opinion. Jim K4JAF

1596. Acom 1010

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-24 13:04:36 UTC
From: Charlie, W0YG
Topic: 1162 Message: 1596

Just got back from VK9XG and VK9CG where I used the little Acom 1010 amplifier. It performed admirably without missing a beat. Wish the factory answered e-mails as well as their amps perform. They seem to ignore their mail, even where URGENT is used in the subject.

73,

Charlie, W0YG..>>

1597. Re: [acom-list] Acom 1010

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-24 20:55:50 UTC
From: Lew Sayre
Topic: 1162 Message: 1597

I have to echo Charlie's observations. I brought my ACOM 1000 to FT5XO where it functioned very well. I recently sent an e-mail to the guys asking about pricing for a couple of 2000A's but no response after a couple of weeks. Maybe they're just too busy with other stuff. Bet they'd sell more amps if they responded to the e-mail.
73 and I remain,
Lew W7EW/W7AT

Difficult to understand why companies offer a great product and their
customer support can be so bad. I have had similar problems with the Acom
American supplier.

1599. responsiveness and service

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-27 16:55:22 UTC
From: pawnpushing
Topic: 1599 Message: 1599

I have been critical of "Acom America".

However, it is necessary to have a slim staff to keep down the overhead. The equipment prices would have to change if they hired a couple of people to answer emails and respond to phone calls. So, yes it is frustrating, but there is also a benefit to small staffs.

My main complaint is that someone needs to write things down rather than "call back tomorrow and remind me". Delays don't bother me nearly as much as a request going into the black hole.

BTW, CQ WW contest saw a cool running amplifier with zero concerns.

Ken

From: Neal Campbell
Topic: 1599 Message: 1600

Just to give a different perspective. I sent them an email 2 weeks ago today asking for a price list. Ordered a 2000 4 days later and received it last Wednesday. I could not get a commitment from any other amp manufacturer to deliver any sooner than 8-10 weeks. I am very happy with my buying experience.

From: edctexas
Topic: 1599 Message: 1601

Mixed feelings about communicating with ACOM-USA. Emails are hit and miss. I think that spam (the plague of plagues) is killing the utility of email. Phone response has been fairly good. Now I have Will's cell number! Maybe that will let me get better service... The new ACOM 200A arrives today! 2 weeks after ordering. It was hard to find out what it would cost but easy to order. I'd say the principle hams involved play radio alot and so are not quite as anxious to "sell" product over email and phone. Still, the amps are great products. Just my opinion 73 Ed KE3D

Thanks to Charlie for great operation. Alot of work for such a small group of one!

1603. Re: [acom-list] Re: responsiveness and service

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-28 22:06:43 UTC
From: Pat Twentythree
Topic: 1599 Message: 1603

I am very happy with the service that I received from ACOM. Last summer, I sent them an email and a few days later I got a response to the questions that I had on the price of the 2000A. All of my contacts were with Will and they were by telephone. Will was very pleasant to deal with and very helpful with all my questions. They had the amplifier in stock at the time I called. On a Tuesday I FAX my order and a copy of my license and on Wednesday, I had my 2000A amplifier at my QTH.

I feel that you need to call them on the telephone and not depend on email. They are a small operation for a large area to cover and they offer an excellent product.

I am very happy with my 2000A and the service.

73,
Pat W1KA

From: Jim Cox
Topic: 1599 Message: 1604

Yes, but what do you do when you call the telephone number, leave messages
on the answering machine and never get a return call? Jim K4JAF

1605. Re: [acom-list] Re: responsiveness and service

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-29 00:14:56 UTC
From: Jim Cox
Topic: 1599 Message: 1605

I did forget to say, my problems with Acom American occurred about 12 months ago so maybe customer service has improved. I wanted the price of the 2000 and was going to order one but after 3 calls and no return, I assumed they didnt need my business. I later bought a used 1000 and been very happy with it. Jim K4JAF

1606. Re: [acom-list] Re: responsiveness and service

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-29 00:21:47 UTC
From: Pat Twentythree
Topic: 1599 Message: 1606

Jim,

If I didn't get a live person when I called, I just hung up and called back later. I never left a message. Will even gave me his cell phone number so that I could contact him with additional questions, if I had some.

73,
Pat W1KA

1607. Re: [acom-list] Re: responsiveness and service

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-29 00:55:23 UTC
From: Jim Cox
Topic: 1599 Message: 1607

I am glad you had such great service, as I said in my earlier email, my experiences were about a year ago so hopefully service has improved.... Do love the 1000. Jim

1608. Re: [acom-list] Acom 1010

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-29 01:17:27 UTC
From: Ron NØAT
Topic: 1162 Message: 1608

I bought an Acom 1010 about a month ago. It arrived just a few days after I ordered it.

I had a few technical questions, so I sent an email to Acom. The reply came back in less than 24 hours. All of my questions were answered in a very detailed manner. Great response!

The amp works great. I especially like the ease in tuning it up. One of the first QSOs was RTTY with VK9CG. Unfortunately, propagation didn't cooperate so I didn't get to attempt to QSO VK9 on the low bands.

I plan to use the 1010 when I travel outside the country. I like the IEC line cord, but the voltage change jumpers could be a bit more convenient.

I'll be using my 2000A at home.

Subject: [acom-list] Acom 1010

Just got back from VK9XG and VK9CG where I used the little Acom 1010 amplifier. It performed admirably without missing a beat. Wish the factory answered e-mails as well as their amps perform. They seem to ignore their mail, even where URGENT is used in the subject.

1609. Re: [acom-list] Re: responsiveness and service

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-29 02:08:59 UTC
From: Ken Waites
Topic: 1599 Message: 1609

Lets say ACOM ships one two amps per day, say 100 per year. If they hired someone to handle the phones, emails, inquiries to improve this area, that person would cost the, say $40K per year in New England. So, increase the price of the amps $400 each.
Suddenly the price of the amp is not so attractive, and they will only sell maybe 80 per year. So not the price has to be increased $500.

It makes their service look pretty good for this amp at this price.

1610. Intermittent Hot Switching

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-29 13:28:50 UTC
From: chp8585
Topic: 1610 Message: 1610

Hello all, I recently purchased an Acom 1000. I use it with a Butternut Vertical antenna. I find that the amp works fine for an hour or 2 then will flash the "Hot Switching" message and shut down. I have checked the antenna and all connections seem tight. Its driving me crazy! cause it will work for a contact and then the next contact it will shut down and then will work again without anything being done to the antenna. Any Ideas? Thanks in advance.

1612. Re: Intermittent Hot Switching

Yahoo group: acom-list (1999 — 2009)
Date: 2005-11-29 16:50:56 UTC
From: edctexas
Topic: 1610 Message: 1612

I think the hot switching alarm occurs when the rig is putting out power when the "Key-In" line has not told the Amp to be putting out RF. Another way of looking at this is the Key-In tells the TR relays in the ACOM 1000 to switch from RX to TX. If the Key-In drops before the rig stops sending RF or is not asserted before the rig starts sending RF this alarm should occur.

Does your rig have a "TX-Inhibit" input for a Key-Out (from the amp) to feed? Another solution would be to use a device like the Microham MK router/keyer. This is a station upgrade that adds a "winkeyer" for CW and is like a deluxe rigblaster interface. But it incorporates a programmable PTT delay for the Amplifier. Drawback is that you need to use the computer to key the rig. The computer USB port tells the MK to key the PA then key the rig. On unkey the reverse happens. Rig unkeys, then the PA.

There are other possible solutions but these are starters for you. 73 es GL Ed KE3D

From: alsopb
Topic: 1610 Message: 1613

Don't know about the 1000 but on the 2000A, this message could also
caused by a sluggish or intermittent vacuum antenna relay.

If the 1000 is like the 2000a, the amp knows when the antenna switch
has closed. If it senses input RF before that, the hot switch error
shows up.

Other things to check. The 2000a vacuum is hot shotted with a higher
voltage initially to increase switch speed. I don't have the
schematic for this. Perhaps something may be wrong there too if the
1000a does the same.

Even without the inhibit line, I had no trouble with the 2000A when
used with an IC-706iig or an MP-1000.

By coincidence I have been in contact with the Acom factory about a periodic ARC FAULT message I get with my Acom 1000 amplifier. They sent back some really juicy information that I would like to share with the group. I will see if I can post the pictures and the file that came with the e-mail after I post this message:

Now please look at the attached picture. Please check whether enough air gap is available between the most domed area of the plate-coil first winding (LP) and the lead electrode of the plate capacitor section CP2. The distance should be 0.2" minimum. If it is considerably smaller, an RF arc might flash over this gap at the modulation peaks.

To check the output relay for bounces, disconnect the amplifier input from the transceiver. Connect an electronic CW keyer to the

KEY-IN input. Go to operate mode and "transmit" a long series of dots and/or dashes. If the "Arc Fault" protection would trip in this conditions, most likely the antenna relay is bounicng too long and this trips the protection.

If you are using the "SEND" control output on the RCA jack of ICOM, I would suggest to change to the ACC connector as described in the attached file IC756cab.txt. This is an electronic output which gives the amplifier an additional timing margin in the beginning of a transmission. A better timing is achieved by the scheme shown in the IC746_Cable.jpg. It uses both outputs simultaneously: the ACC in the beginning, and the RCA "SEND" jack at the end of a transmission. The schematic is shown for IC-746 but it is valid for the whole IC-756 series.

Still another "Arc Fault" problem we know is with Ten-Tec ORION model. We resolved it by inserting a High-Pass filter between the transceiver output and the ACOM input. It appeared that a (small) parasitic emission from the transceiver in the LF range was misleading the ACOM protection. I have no such information concerning ICOM radios but I can give you the schematic and parts details of a simple but proven HP filter.

I hope this helps....

Rich, before you tear the amp apart, are you fully sure Butternut is 100% working? Maybe one of the capacitors has broken down. A guy here in the UK had a similar problem which turned out to a capacitor.

I had an Arc Fault on my 1000 just before the end of CQWW and found a connection on my 80m gp and burnt out.

Hello all, I recently purchased an Acom 1000. I use it with a Butternut Vertical antenna. I find that the amp works fine for an hour or 2 then will flash the "Hot Switching" message and shut down. I have checked the antenna and all connections seem tight. Its driving me crazy! cause it will work for a contact and then the next contact it will shut down and then will work again without anything being done to the antenna. Any Ideas? Thanks in advance.

Thanks to all who have responded. My equipment is as follows FT1000MKV using Rigblaster pro, Heil footswitch, writelog software. The Hot switching message occurs immediately on Transmit so maybe its the timing suggested by Ed. I have a Heil foot switch which utilizes a micro switch which enables the amp to key first but haven't used that connection, using the rig to amp connection as per the manual. I'll try the footswitch-amp connection and see if helps with the problem. Thanks again!!

... it is 99% that RF is coming out of the FT1000MKV too early. We had exactly the same problems when we prepared the stations for ZA1A. You can now easily check this with the Heil footswitch. After that I would make the following cable for the FT1000, thats what we did.
Here is the info: http://www.albany.net/~bg/Yaesu/MPAcom.htm

By coincidence I have been in contact with the Acom factory about a periodic ARC FAULT message I get with my Acom 1000 amplifier. They sent back some really juicy information that I would like to share with the group. I will see if I can post the pictures and the file that came with the e-mail after I post this message:

Now please look at the attached picture. Please check whether enough air gap is available between the most domed area of the plate-coil first winding (LP) and the lead electrode of the plate capacitor section CP2. The distance should be 0.2" minimum. If it is considerably smaller, an RF arc might flash over this gap at the modulation peaks.

To check the output relay for bounces, disconnect the amplifier input from the transceiver. Connect an electronic CW keyer to the KEY-IN input. Go to operate mode and "transmit" a long series of dots and/or dashes. If the "Arc Fault" protection would trip in this conditions, most likely the antenna relay is bounicng too long and this trips the protection.

If you are using the "SEND" control output on the RCA jack of ICOM, I would suggest to change to the ACC connector as described in the attached file IC756cab.txt. This is an electronic output which gives the amplifier an additional timing margin in the beginning of a transmission. A better timing is achieved by the scheme shown in the IC746_Cable.jpg. It uses both outputs simultaneously: the ACC in the beginning, and the RCA "SEND" jack at the end of a transmission. The schematic is shown for IC-746 but it is valid for the whole IC-756 series.

Still another "Arc Fault" problem we know is with Ten-Tec ORION model. We resolved it by inserting a High-Pass filter between the transceiver output and the ACOM input. It appeared that a (small) parasitic emission from the transceiver in the LF range was misleading the ACOM protection. I have no such information concerning ICOM radios but I can give you the schematic and parts details of a simple but proven HP filter.

I hope this helps....

It is the "Model 2203 High Pass Filter" whicn prevents any possible low level VLF oscillations from tripping fault circuitry. It has a cut off of about 1.7 Mhz, and fits between the Orion and the Acom.

Well I have used the Heil footswitch to activate the amp for the last 2 days with no "Hot Switching" indications. It looks like Carsten was correct. I'll be scrounging for some parts to build the cable. Many thanks for the help. I was going crazy trying to figure it out!

This was a problem I had as well with the Acom 2000A. The solution was the same as Carsten describes. Heil footswitch introduced just enough delay to permit smooth switching. In use several years now.I did not need a special cable.

... it is 99% that RF is coming out of the FT1000MKV too early. We had exactly the same problems when we prepared the stations for ZA1A. You can now easily check this with the Heil footswitch. After that I would make the following cable for the FT1000, thats what we did.
Here is the info: http://www.albany.net/~bg/Yaesu/MPAcom.htm

73ss

Carsten, DL6LAU

Thanks to all who have responded. My equipment is as follows
FT1000MKV using Rigblaster pro, Heil footswitch, writelog software.
The Hot switching message occurs immediately on Transmit so maybe its the timing suggested by Ed. I have a Heil foot switch which utilizes a micro switch which enables the amp to key first but haven't used that connection, using the rig to amp connection as per the manual. I'll try the footswitch-amp connection and see if helps with the problem.
Thanks again!!

Hi all ACOM users,

Hereby I would like to let you all know what happened with the
humming ACOM 1000 as listed below?

Cor (representative of ACOM in PA land) replaced the unit some weeks
after I notified him about the bad test results. A short test was
enough to show Cor the behaviour I mentioned. (And various e-mails to
ACOM, Stan was very very helpful.)

This new unit is a different piece of cake! This one does the REAL
1000 watts with 70 watts input on most of the bands as described in
the ACOM brochure and does not hum that bad as the previous amp.

I would like to express my thanks to Cor who solved this problem as
quick as possible, and would like to thank ACOM for the fast delivery
of the new amplifier to Cor.

1628. Acom Arc Fault with Icom 756 PRO II when using beverage RX Antennas

Yahoo group: acom-list (1999 — 2009)
Date: 2005-12-21 06:18:13 UTC
From: w0uce
Topic: 1628 Message: 1628

My Acom 2000A is driven by an ICOM 756 PROII. When operating full break in CW and I attempt to use a separate RX Antenna the Acom goes into Arc Fault following "Key Up" after the first dit or dah is sent. I can see a short (1/3 - 1/2 second) low level burst of RF on a cross needle SWR meter which causes the Acom to go into Arc Fault.

The same thing happens if the Acom is connected to a dummy load or transmit antenna. I am using a DX-Peditition II to key the Acom and the DXPII also feeds the separate RX antenna to the PROII's main antenna jack. I am not using the separate RX antenna input however I have tried using the RX antenna input and the problem persists.

When using the same antenna for TX/RX the problem does not occur.

If anyone knows what is causing the problem and has a fix for this I would greatly appreciate any suggestions or recommendations you can offer.

Thanks,
Jack W0UCE

Jack,

Bert mentioned this problem.

This sounds like the mysterious problem some had with the ORION (I think) It was traced down to a low freq signal being put out by the Orion on the coax. Some kind of filter was installed in the line which solved the problem. Later runs of the ORION had the filter built in.

Is it only the 756? Do you have the same problem with other rigs.

Perhaps you're picking up a broadcast station on the RX antenna and that's driving the freq counter input to the ACOM nuts. It doesn't take much power for this freq counter. I was fooling around with a less than 50mw Rockmite QRP rig. It drove the ACOM2000 just fine and the freq counter worked. Perhaps a broadcast band filter on the RX antenna would solve the problem. Have you a spare tuner you can plop into the RX antenna line to try filtering out signals outside the desired band?

Such a prob existed in the past with early serial numbered ACOMs when used with TenTec. TenTec sent out a high pass filter to fix the problem, with cut off of 1.7 Mhz. It fits between exciter and amp. It may be that ICOM will supply such a filter. Otherwise contact Array Solutions WX0B as they have such a product.

1632. Arc Fault when using separate RX antenna - Clarification

Yahoo group: acom-list (1999 — 2009)
Date: 2005-12-22 14:39:44 UTC
From: w0uce
Topic: 1632 Message: 1632

Thanks to those of you who responded with suggestions.

For clarification, the problem I am experiencing is on "KEY UP" operating CW. An external cross needle SWR meter shows a low level RF Spike lasting about 1/3 to 1/2 second after a key or keyer completes sending the first dit or dah.

I am using a KD9SV DX-Pedition II to key the amp and the DXPII allows selection of up to 4 separate RX Antennas. The problem persists with the DXP-II in line and also when the DXP-II is not in line and a separate RX antenna is connected to the RX antenna jack on the back of the Icom 756 PRO II.

The problem occurs if the amp is connected to an Antenna and also when the amp is connected to a dummy load which suggests the problem is being caused by a spike coming from the Pro II.

I contacted one of the Icom service centers and the Tech said he was not aware of any spike problem and advised me to contact Icom America which I did; they have not yet responded.

Several people have also suggested the problem could be low level RF coming from a broadcast station and the Acom fault detect is triggering the Arc fault. Installing a high pass filter between the PROII and Acom has been suggested as a way to solve the problem.

If anyone has other ideas after reading this "clarification" I would appreciate any and all opinions and suggestions.

Thanks,
Jack W0UCE

1633. RE: [acom-list] Arc Fault when using separate RX antenna - Clarification

Yahoo group: acom-list (1999 — 2009)
Date: 2005-12-22 16:05:40 UTC
From: Bob Naumann - W5OV
Topic: 1632 Message: 1633

In your first message you said:

"When using the same antenna for TX/RX the problem does not occur. "

I read that to mean that you don't use the KD9SV box then - is that right? This would be just the 756 ProII connected to your Acom - am I reading that right?

Assuming that I am interpreting that correctly; if you don't see this "spike" without the KD9SV device, wouldn't that mean that the radio is *not* the cause and perhaps the KD9SV box is the more likely suspect?

I would rather suspect something in your interconnection of these devices and perhaps the way the KD9SV box is keying the amp - may be causing a key down condition to be fed back into the ProII somehow - rather than the radio continuing to put out a signal when it shouldn't.

How do you have all this stuff wired up? Have you communicated with KD9SV about this?

I would look there and leave the Icom alone - again, presuming you don't see this behavior without the KD9SV box.

I have been looking at the KD9SV device ads and it says a couple things:

"Contains "Soft keying" circuitry with Linear Amplifier keying Relay."

"Compatible with both QSK and non-QSK amplifiers"

Probably needs more investigation.

1635. [acom-list] Arc Fault when using separate RX antenna

Yahoo group: acom-list (1999 — 2009)
Date: 2005-12-22 22:11:56 UTC
From: Howard Klein
Topic: 1632 Message: 1635

I had a similiar experience with a Mark V and the KD9SV switch. Not implying the switch was the problem since I had the fault problem without the switch. When I added the Heil footswitch, it cured the timing problem and the fault. Just my experience.

Subject: Re: [acom-list] Acom Arc Fault with Icom 756 PRO II when
using beverage RX Antennas]

Dear Vagn,

We have had a problem with Ten-Tec ORION nearly a year ago. We
resolved it with the kind collaboration of Ten-Tec by introducing a
High-Pass Filter between the ORION output and the ACOM input.

I suppose that similar problem could arise if any LV/VLF spur is
generated in the ICOM/ACOM system when a 20-dB or more pre-amplifier
and additional antenna is included in the RF loop there by DX-
Peditition II. It could appear for instance during the periods of
RX/TX switching over and it could be not present during constant RX
or TX regimes. Unfortunately, we do not have this device available
to investigate it. It would be of use if you could give us some
details or schematic diagram.

In case that you would see a similar problem, you may try using a
HPF in a similar way. Please find zipped a Word file describing a
proven 1.7MHz High-Pass filter. You may try to place one between the
ACOM RF input and the YAESU antenna output. Alternatively, you may
try the commercially found DUNESTAR 400-HPF model.

Please inform me again.

Jack,

What did you mean when you said:

"When using the same antenna for TX/RX the problem does not occur. "

73,

Bob W5OV

Carsten:

Yes the problem occurs with or without the DX-Pediton II in line or not.

73,
Jack

Am connecting my Kenwood TS-2000 to the ACOM 1000. Has anyone else done this?

If so, I suspect that the Amp KEY-IN is from the TS-2000 REMOTE pin 2 (gnd-common) to pin 4 (center on RCA phono plug).

Has anyone used the Amp KEY-OUT to connect with the TS-2000 REMOTE pin 2 (gnd-common) to pin 5 (center on RCA phono plug)?

I have not used the ACOM with the TS2000 but I am familiar with it. You should not need the "Key-Out" connection for the Kenwood. The connection for the "Key-In" seems correct. That is the "PTT-Out" of the Kenwood going to the "Key-In" of the ACOM. You should not need any other connection other than the RF.

The Key-Out comes from the Amp and is used to prevent the rig from outputing RF until the AMP has switched The input to the amp and the amp to the antenna. Some Rigs like the Ten-Tecs use this keying loop to help them in QSK CW. You shouldn't need this connection.

You'll like the quick tune up. The only thing that is faster in tuning is an automatic tuning like the 2000A. Welcome to the ACOM group and family. I love my amp. 73 Ed KE3D

I been playing with the Acom Tools software , Trying to get the software to turn the amp ON with no success, also theirs mention that Gerry Hulls description might be Helpful and additional card? may be required. Any body have any success getting their acom to turn using the software also I have had sporadic errors on the auto tune feature and auto shutdowns . I am using XP operating system the switch everything else seems to work ok. If their a magic fix or better program to run the amp Please fill me in.

The little bit I played with the tools software showed several short comings. The first is that the remote start and remote stop didn't seem to work (or I'm stupid). The next thing is that once the software is talking to the amp, the amp can't be shutdown or started with the cable connected to an active PC.

Some of the other stuff seems slightly buggy to me. Perhaps I'm too dense to understand the documentation. I can understand the amp manual but not the software.

I have managed to get the comm port to commmand the amp to change tuning segments. I hope to have the radio talk to a PIC micro which will command the amp to follow. I just like the idea of the amp being on the right band segment before keying I guess. Perhaps I can try remote tuning but no success with ACOM TOOls.

Hope that the bleak review helps. What been done is cool but in my opinion it is still a work in progress. 73 Ed KE3D

Acom Tools was written by a Bulgarian about 5-6 years ago. It works fine on my Win98 system, but doesn't work on my XP system. I've asked both Acom and the programmer about an update. Without going into details, they are no longer talking to each other due to some "miscommunications."

A few years later, Gerry, W1VE, began writing a control program for the amp. He promised it "shortly" several times. For reasons only Gerry can answer, it was never released.

Currently, we have a great amp that can be further enhanced with some software, yet that software doesn't exist and to the best of my knowledge is not being written. It's a shame...

Hello Everyone,

Is there some listing for the 2000A that has the communication protocol
? I might take a crack at it in Visual Basic. I am a new 2000A owner,
inherited from my dad N9QX (SK). Ideas ?? Comments ??

ACOM tools executes ok my XP OS here. It is clunky software. And I can't understand why the bit rate
is so slow on the serial port which causes the "seconds" delay for measurements. Strange. Perhaps,
I don't fully understand how to get full functionality out of it.

I did not add another card for AC control, perhaps that doesn't work in XP as I did not try it.
I found the software more of a novelty than of any real use. Yes, hopefully a code writer will buy one
of these someday!

Gerald,

This was my idea quite a few years ago. I've written quite a bit of rig control software.

The specs are available on a xcel spreadsheet for some odd reason. I don't have them any more. They are incomplete and have no attached explanations.

My conclusions:
1) The control of the ACOM is not like any rig you've experienced.
2) The goofy networking (very non standard) and network care and feeding introduce untold problems including those of timing.

What really is needed is a rewrite of the ACOM ROM software to accept input like rig control commands. Also it would help if the acom also accepted some binary switch inputs in addition to COM (USB?) port commands.

I could never do anything really simple like move to a new band segment via com port control.

There are basic examples out there which do some simple things.

Good luck if you attempt this route. It was beyond my abilities. Given the several failures of more accomplished programmers, I don't feel too bad.

1650. Control Cable

Yahoo group: acom-list (1999 — 2009)
Date: 2006-01-08 00:30:54 UTC
From: wb5xxark
Topic: 1650 Message: 1650

Can anyone tell me if Acom has the 6-wire control cable in stock.I need 200' plus connectors each end.Also a price per ft. if you know.This is the cable for the outside 2000SW switch.

Thanks George wb5xx

1651. TS-2000 & ACOM1000 guide

Yahoo group: acom-list (1999 — 2009)

From: Gus
Topic: 1651 Message: 1651

A most generous list member sent me a guide to connect the ACOM 1000
to my TS-2000. Myt mailbox got corrupted, and I lost your email, along
with many others.

Would you please re-send it. It was excellent.

73/gus

Topic: 1654 Message: 1654

Does anyone here know the pin numbers on the FT1000MP band data plug
for the shielded lead to the ACOM 1010. I can't locate the manual.
Thnks for any help.

73,

Alan/K6SRZ

1655. Re: what did i do wrong...oops

Yahoo group: acom-list (1999 — 2009)
Date: 2006-01-20 16:01:43 UTC
From: Bill NY9H
Topic: 1654 Message: 1655

guess i have some RF thing going on here , which is bad.

using a 80 inverted L my 2000a goes into arc protect....after i hit a level of 400 watts. I did find out what I can do to remove the problem. I can turn off my alternate receive antenna on the Icom pro3!!!!!

If i using the inv L as the t/r antenna no problem!!!!!

At first I thought the arc was out there somewhere. Upon another looksee (doing the bad things again) ; I see that the 2000a power & swr are going to max which is probably a great reason for something to ARC!!!! (NOT GOING TO DO THIS AGAIN... at least till I do some remedial effort.

My "receive" antenna IS quite close to the other antenna and is a dipole... so maybe somehow this stuff is looping around in my mess of antenna switching??? and coupling back into my exciter to amp lines??? feedback ???? I did not have the time to look back at the ICOM to see if it went to full tilt also.

does this sound like a plausible deduction...?

other ideas (other than DON'T DO THAT AGAIN !!!!!)

It seems like if i just ground the rcv ant during xmit , i would be ok.

Bill ny9h

1657. RE: [acom-list] Re: what did i do wrong...oops

Yahoo group: acom-list (1999 — 2009)

From: Neal Campbell
Topic: 1654 Message: 1657

I was discussing this with one of our local gurus. I think receive antennas are prime suspects of rf entering the shack. He told me of a local contester that had his system designed so that during transmit it disconnected the receive antenna to block the rf. Once the ptt was off, the receive antenna would restore connectivity to the rig.

Have no idea what magic was used to perform this, just reporting what I thought was interesting!

1661. Re: [acom-list] FT1000MP connections to ACOM 1010

Yahoo group: acom-list (1999 — 2009)
Date: 2006-01-20 19:55:50 UTC
From: Hans Remeeus
Topic: 1661 Message: 1661

Hello Alan,

This information would be the same for the ACOM1000 and ACOM1010:

Here is the information you may need to connect properly your FT1000MP
to the ACOM2000A for QSK operation in order to get best results.

1. You will need the following materials to prepare a control cable:

- a piece of two-lead shielded (audio) cable, maximum 3m/11ft long,
- a resistor 10kOhm 0,125W,
- an male DIN-8 (8 pins) connector (mating to FT1000MP BAND DATA connector),
- two phono type (RCA, CINCH) connectors (mating to ACOM2000A KEY-IN and
KEY-OUT connectors).

2. Look into the FT1000MP OPERATING MANUAL. Find the layout of the BAND
DATA connector, located on the top-right corner of page 4. Note that the
DIN-8 connector pins are numbered in a special order: not successively
but as follows:

```
2-----------------TX GND - to KEY-IN
4 5
+13V---o---1 6 3----------------GND - two shields
| 7 8---o------TX INHIBIT - to KEY-OUT
| |
----10kOhm----
```

(DIN-8, as viewed from the transceiver's rear panel "BAND DATA" and from
the sodering side of the male cable connector)

pin1 (+13V) - left from the center,
pin2 (TX GND) - on the top,
pin3 (GND) - right from the center,
pin4 (BAND DATA A, not used) - above pin 1,
pin5 (BAND DATA B, not used) - above pin 3,
pin6 (BAND DATA C, not used) - the central,
pin7 (BAND DATA D, not used) - below pin 1,
pin8 (TX INHIBIT) - below pin 3.

3. First solder the 10 kOhm resistor between pins 1 (+13V) and 8 (TX
INHIBIT). This "pull-up" resistor is needed for FT1000MP in order to
activate its "TX INHIBIT" input. Now, if you connect this DIN-8
connector to the BAND DATA, the transceiver wow'nt transmit until you
pull pin 8 (TX INHIBIT) to the ground. This is what ACOM2000A does to
enable transmitting selectively, when its antenna relay is in safe
condition (steadily closed or open).

Before trimming the cable end, thread on it the DIN-8 protective cap. Solder cable shields together and then to pin 3 (GND). Solder one of the active leads to pin 8 (together with one of the resistor leads). Mark the other end of this active lead as KEY-OUT. Solder the second active lead to pin 2 (TX GND). Mark its second end as KEY-IN. Keep track on all parts and leads to be well insulated when assembling DIN-8 protective cap in order not to make any short connection between pins.

Split the second cable end and thread the two phono connector accessories. Solder the active KEY-IN and KEY-OUT leads to the central pins and their shields to the outer connector rings. Assembly the connector's protective caps and your control cable is ready.

4. Before connecting or disconnecting cables always switch off both the transceiver and the amplifier.

Look in the FT1000MP OPERATING MANUAL. Find the Rear Panel Controls & Connectors on page 19/20.

Slide the LIN switch (21), located in a slot on the FT1000MP rear panel, to the OFF position. This will disable the internal TX GND relay of the transceiver and your QSK-CW timing will get better. Using this mode is possible as the amplifier's input KEY-IN is sensitive enough and does not require any relay buffering.

Connect the DIN8 connector of the prepared control cable to the BAND DATA (16) connector of FT1000MP.

Now look in the ACOM2000A OPERATING MANUAL. Find Fig.2-2 "Connections" on page 8. Connect the cable KEY-IN and KEY-OUT to the same name connectors (d) and (e) of the amplifier (bottom left corner as seen from rear). See also the respective pagraphs (d) and (e) on page 9.

5. Now you can use the QSK feature of both FT1000MP and ACOM2000A with maximum switching safety and timing quality. You don't need doing anything more and the following information is only intended to give some additional technical information about ACOM2000A KEY-IN and KEY-OUT signals.

a) The KEY-IN socket on the rear panel is the antenna relay transmit/receive control input of the amplifier.

When in OPERATE, on this input appears a DC signal which must be held to ground to activate the amplifier in transmit. This can be done via a relay contact or semiconductor (transistor or integrated circuit) with suitable polarity (positive to ground).

The electrical specifications for the respective transceiver's output are: - switching voltage (open circuit) minimum 12V;
- switching current (closed circuit) minimum 12mA;
- voltage drop or resistance @ 12mA current (closed circuit) maximum 1.5V/250 Ohm.

FT1000MP output exceeds all of them.

You can control the KEY-IN signal in two different ways.

The preferred mode is to connect the KEY-IN socket with a shielded cable to the transceiver's output which goes to ground on transmit. The FT1000MP corresponding output is named TX GND (pin 2 of BAND DATA connector) and its electrical specifications exceed the needs without any buffering.

You don't need using the followign second way with FT1000MP. It may be useful with any old type transceiver which may have not a suitable output, providing the "ground on transmit" output signal. Connect with a shielded cable the PTT or CW keyer contact to the amplifier rear panel KEY-IN socket. Then connect with a shielded cable the amplifier rear panel KEY-OUT socket to the PTT or CW-KEY transceiver input. In this mode the amplifier will just pass directly the PTT or keyer signal to the transceiver when not powered and in STBY. In OPERATE mode it will follow it always when the antenna relay and/or band switch are in safe position and will disable transmitting during their motion or any risk situation.

Have in mind that the second way of transmit/receive control could be very useful also if a transceiver has improper sequency of its T/R signals. For instance, in some old type transceivers, the "ground on transmit" signal is late at beginning (RF power appears before it); or it competes at the end of transmission (disappears before RF power).

b) The KEY-OUT socket on the rear panel is an extra output signal from the amplifier to the transceiver. It could be used to improve the T/R switching process and increases the exploitation reliability of the amplifier and of the transceiver too. This output can be used in two cases:

- when your transceiver has the respective input to disable transmitting and the preferred connection of the KEY-IN socket is made - see (a). For FT1000MP this is the TX INHIBIT input (pin 8 of BAND DATA connector). We recommend that you connect it with a shielded cable to the KEY-OUT of the amplifier.

- when the second may of transmit/receive control is used with any old-type of transceiver - see (a).

The output KEY-OUT of the amplifier is open drain circuit and it can hold to ground a positive DC signal. At the moments when the amplifier is ready to transmit this line is held to ground, When transmitting is not permissible the output is open (for instance when the antenna relay is in process of switching or the band switch is rotated).

The electrical specifications of the amplifier's output are: switching voltage capability (open circuit) up to +50V; switching current capability (closed circuit) up to 20mA; resistance @ 20mA current (closed circuit) maximum 120 Ohm.

When the amplifier is not powered and also in STANDBY mode this output is directly connected to the KEY-IN socket. Then the amplifier will

return the "TX GND" signal back to the "TX INHIBIT" in order to enable
transmitting.

In OPERATE mode the KEY-OUT signal will follow the incoming on the
KEY-IN socket "TX GND" always when the antenna relay and/or band switch
are in safe position and will reject transmitting if any risk condition
is detected.

At our contest station, we ground our beverage antenna during TX. Simply done, you just need to find somewhere to have a relay (SPDT) ground the antenna lead.

On my IC756Pro III there is a connection on the back that if the Radio goes into TX will ground that lead. You use this to ground the relay coil.

Have a look at your manual.

1663. Re: [acom-list] Re: what did i do wrong...oops

Yahoo group: acom-list (1999 — 2009)
Date: 2006-01-20 21:26:18 UTC
From: Bill NY9H
Topic: 1654 Message: 1663

1. no alpha-delta switches,,,
2. I have done presets for this antenna recently...
3. I concur that the easiest way should be to just ground the
receive antenna when going into xmt,.... I'll report back abouit the
success of that...

tnx all....

bill

1664. Icom PRO 3 - Acom Arc Fault Problem

Yahoo group: acom-list (1999 — 2009)
Date: 2006-01-21 15:23:07 UTC
From: j a ritter
Topic: 1664 Message: 1664

Bill:
I just went through the same thing with my PRO II and Pro III radios driving an Acom 2000A when I attempted using a separate RX antenna. The problem I had may be very similar to yours and it is terribly frustrating to resolve. Here are the key points:

1. How old is your Acom Amp? (Mine was manufactured in 1999)
Acom came out with two modifications to the transceiver interface board that coarsens the Arc Fault Sensing. (If your amp does not have these mods, likely this is part of your problem)
2. The second part is likely how you are keying the Amp.
(a) Are you keying from the Send Jack on the Pro III or From one of the Accessory Jacks. The Send Jack keying method is slower than the ACCY Jack method and it therefore overcame my problem of the Acom being unterminated during T/R changeover. My problem was on "Key Up" not "Key Down" this is another thing you need to be sure to identify.

After weeks of frustration and trouble shooting, my problem was resolved by making the two mods recommended by Acom and changing how I was keying the Acom.

I also added an outboard device to key the Amp and also provide RX antenna input to the Pro II or Pro III through the RF Jack (SO-239) on the radio versus the RX Antenna RCA Jack. This device is the DX-Pedition II by Gary Nichols KD9SV. Here is a link:
http://www.radio-ware.com/products/svdxii.htm

I can provide you with the Acom Mod information as well. It would be much easier to get into the problem more if we talk by phone than sending e-mail. If you would like to discuss how I resolved my problem, e-mail your phone number to me and I will call you.

Subject: Re: what did i do wrong...oops

guess i have some RF thing going on here , which is bad.

using a 80 inverted L my 2000a goes into arc protect....after i hit a
level of 400 watts. I did find out what I can do to remove the problem.
I can turn off my alternate receive antenna on the Icom pro3!!!!!

If i using the inv L as the t/r antenna no problem!!!!!

At first I thought the arc was out there somewhere. Upon another looksee
(doing the bad things again) ; I see that the 2000a power & swr are
going to max which is probably a great reason for something to
ARC!!!! (NOT GOING TO DO THIS AGAIN... at least till I do some
remedial effort.

My "receive" antenna IS quite close to the other antenna and is a
dipole...
so maybe somehow this stuff is looping around in my mess of antenna
switching??? and coupling back into my exciter to amp lines???
feedback ???? I did not have the time to look back at the ICOM to see
if it went to full tilt also.

does this sound like a plausible deduction...?

other ideas (other than DON'T DO THAT AGAIN !!!!!)

It seems like if i just ground the rcv ant during xmit , i would be ok.

Subject: FT1000MP connections to ACOM 1010

This should be an easy one for those of you who have the manuals. What pins do I connect on the FT1000MP band data plug to interface with an ACOM 1010.

Thanks for any help.

I was discussing this with one of our local gurus. I think receive antennas
are prime suspects of rf entering the shack. He told me of a local contester
that had his system designed so that during transmit it disconnected the receive antenna to block the rf. Once the ptt was off, the receive antenna
would restore connectivity to the rig.

Have no idea what magic was used to perform this, just reporting what I thought was interesting!

From: Hans Remeeus <hans@...>
Subject: Re: FT1000MP connections to ACOM 1010

Hello Alan,

This information would be the same for the ACOM1000 and ACOM1010:

Here is the information you may need to connect properly your FT1000MP
to the ACOM2000A for QSK operation in order to get best results.

1. You will need the following materials to prepare a control cable:

- a piece of two-lead shielded (audio) cable, maximum 3m/11ft long,
- a resistor 10kOhm 0,125W,
- an male DIN-8 (8 pins) connector (mating to FT1000MP BAND DATA
connector),
- two phono type (RCA, CINCH) connectors (mating to ACOM2000A KEY-IN and

KEY-OUT connectors).

2. Look into the FT1000MP OPERATING MANUAL. Find the layout of the BAND
DATA connector, located on the top-right corner of page 4. Note that the

DIN-8 connector pins are numbered in a special order: not successively
but as follows:

```
2-----------------TX GND - to KEY-IN
4 5
+13V---o---1 6 3----------------GND - two shields
| 7 8---o------TX INHIBIT - to KEY-OUT
| |
----10kOhm----
```

(DIN-8, as viewed from the transceiver's rear panel "BAND DATA" and from

the sodering side of the male cable connector)

pin1 (+13V) - left from the center,
pin2 (TX GND) - on the top,
pin3 (GND) - right from the center,
pin4 (BAND DATA A, not used) - above pin 1,
pin5 (BAND DATA B, not used) - above pin 3,
pin6 (BAND DATA C, not used) - the central,
pin7 (BAND DATA D, not used) - below pin 1,
pin8 (TX INHIBIT) - below pin 3.

3. First solder the 10 kOhm resistor between pins 1 (+13V) and 8 (TX INHIBIT). This "pull-up" resistor is needed for FT1000MP in order to activate its "TX INHIBIT" input. Now, if you connect this DIN-8 connector to the BAND DATA, the transceiver wow'nt transmit until you pull pin 8 (TX INHIBIT) to the ground. This is what ACOM2000A does to enable transmitting selectively, when its antenna relay is in safe condition (steadily closed or open).

Before trimming the cable end, thread on it the DIN-8 protective cap. Solder cable shields together and then to pin 3 (GND). Solder one of the

active leads to pin 8 (together with one of the resistor leads). Mark the other end of this active lead as KEY-OUT. Solder the second active lead to pin 2 (TX GND). Mark its second end as KEY-IN. Keep track on all

parts and leads to be well insulated when assembling DIN-8 protective cap in order not to make any short connection between pins.

Split the second cable end and thread the two phono connector accessories. Solder the active KEY-IN and KEY-OUT leads to the central pins and their shields to the outer connector rings. Assembly the connector's protective caps and your control cable is ready.

4. Before connecting or disconnecting cables always switch off both the transceiver and the amplifier.

Look in the FT1000MP OPERATING MANUAL. Find the Rear Panel Controls & Connectors on page 19/20.

Slide the LIN switch (21), located in a slot on the FT1000MP rear panel,

to the OFF position. This will disable the internal TX GND relay of the transceiver and your QSK-CW timing will get better. Using this mode is possible as the amplifier's input KEY-IN is sensitive enough and does not require any relay buffering.

Connect the DIN8 connector of the prepared control cable to the BAND DATA (16) connector of FT1000MP.

Now look in the ACOM2000A OPERATING MANUAL. Find Fig.2-2 "Connections" on page 8. Connect the cable KEY-IN and KEY-OUT to the same name

connectors (d) and (e) of the amplifier (bottom left corner as seen from

rear). See also the respective pagraphs (d) and (e) on page 9.

5. Now you can use the QSK feature of both FT1000MP and ACOM2000A with maximum switching safety and timing quality. You don't need doing anything more and the following information is only intended to give some additional technical information about ACOM2000A KEY-IN and KEY-OUT

signals.

a) The KEY-IN socket on the rear panel is the antenna relay transmit/receive control input of the amplifier.

When in OPERATE, on this input appears a DC signal which must be held to ground to activate the amplifier in transmit. This can be done via a relay contact or semiconductor (transistor or integrated circuit) with suitable polarity (positive to ground).

The electrical specifications for the respective transceiver's output are: - switching voltage (open circuit) minimum 12V;
- switching current (closed circuit) minimum 12mA;
- voltage drop or resistance @ 12mA current (closed circuit) maximum 1.5V/250 Ohm.

FT1000MP output exceeds all of them.

You can control the KEY-IN signal in two different ways.

The preferred mode is to connect the KEY-IN socket with a shielded cable

to the transceiver's output which goes to ground on transmit. The FT1000MP corresponding output is named TX GND (pin 2 of BAND DATA connector) and its electrical specifications exceed the needs without any buffering.

You don't need using the followign second way with FT1000MP. It may be useful with any old type transceiver which may have not a suitable output, providing the "ground on transmit" output signal. Connect with a

shielded cable the PTT or CW keyer contact to the amplifier rear panel KEY-IN socket. Then connect with a shielded cable the amplifier rear panel KEY-OUT socket to the PTT or CW-KEY transceiver input. In this mode the amplifier will just pass directly the PTT or keyer signal to the transceiver when not powered and in STBY. In OPERATE mode it will follow it always when the antenna relay and/or band switch are in safe position and will disable transmitting during their motion or any risk situation.

Have in mind that the second way of transmit/receive control could be very useful also if a transceiver has improper sequency of its T/R signals. For instance, in some old type transceivers, the "ground on transmit" signal is late at beginning (RF power appears before it); or

it competes at the end of transmission (disappears before RF power).

b) The KEY-OUT socket on the rear panel is an extra output signal from the amplifier to the transceiver. It could be used to improve the T/R switching process and increases the exploitation reliability of the amplifier and of the transceiver too. This output can be used in two cases:

- when your transceiver has the respective input to disable transmitting

and the preferred connection of the KEY-IN socket is made - see (a). For

FT1000MP this is the TX INHIBIT input (pin 8 of BAND DATA connector). We

recommend that you connect it with a shielded cable to the KEY-OUT of the amplifier.

- when the second may of transmit/receive control is used with any old-type of transceiver - see (a).

The output KEY-OUT of the amplifier is open drain circuit and it can hold to ground a positive DC signal. At the moments when the amplifier is ready to transmit this line is held to ground, When transmitting is not permissible the output is open (for instance when the antenna relay is in process of switching or the band switch is rotated).

The electrical specifications of the amplifier's output are: switching voltage capability (open circuit) up to +50V; switching current capability (closed circuit) up to 20mA; resistance @ 20mA current (closed circuit) maximum 120 Ohm.

When the amplifier is not powered and also in STANDBY mode this output is directly connected to the KEY-IN socket. Then the amplifier will return the "TX GND" signal back to the "TX INHIBIT" in order to enable transmitting.

In OPERATE mode the KEY-OUT signal will follow the incoming on the KEY-IN socket "TX GND" always when the antenna relay and/or band switch are in safe position and will reject transmitting if any risk condition is detected.

Subject: Re: Re: what did i do wrong...oops

At our contest station, we ground our beverage antenna during TX.
Simply
done, you just need to find somewhere to have a relay (SPDT) ground the
antenna lead.

On my IC756Pro III there is a connection on the back that if the Radio

goes into TX will ground that lead. You use this to ground the relay
coil.

Have a look at your manual.

Subject: Re: Re: what did i do wrong...oops

1. no alpha-delta switches,,,
2. I have done presets for this antenna recently...
3. I concur that the easiest way should be to just ground the
receive antenna when going into xmt,.... I'll report back abouit the
success of that...

tnx all....

1665. Re: [acom-list] Icom PRO 3 - Acom Arc Fault Problem

Yahoo group: acom-list (1999 — 2009)
Date: 2006-01-21 18:24:40 UTC
From: Thomas Herrmann
Topic: 1664 Message: 1665

well done, Jack !
I became aware of the DXped II in another e-mail list and got it some days before. It took only 5 minutes to install it between TRX and PA ACOM2000A (by using adapters BNC/PL). As far as DXped II has a TX sequencer built in, the TX/RX antennas are switched before the PA is keyed. I use it for fast QSK without any trouble (up to now ;-))).
good luck, Bill !

1666. LATEST PRICES!

Yahoo group: acom-list (1999 — 2009)
Date: 2006-01-31 01:20:11 UTC
From: FIL
Topic: 1666 Message: 1666

Gents!

Anyone who can provide me the latest pricelist of the ACOM amps? Either in british pound or U.S. dollar. I am in the process of buying an rf amplifier. I am 99% convinced on your evaluations.

I would gladly appreciate any information.

DU7FBT

From: shapiro_martin
Topic: 1667 Message: 1667

It's time to look at the foam filter behind the amp and ensure it is clean. A dust clogged filter will not allow proper air flow and cooling. I know how easy this is to forget.

I have a metal mesh pre-filter on my 2000A. The foam is indeed quite thin and this way in dusty Arizona I am keeping more dust out of the amp's innards. I clean the pre-filter and foam every 60 days and it's amazing how dusty it becomes....Now we have a clean home but between the dogs and dusty outside air I'm constantly blowing dust out of the Ham gear

1668. RE: [acom-list] acom 2000a and aux fan

Yahoo group: acom-list (1999 — 2009)
Date: 2006-02-12 13:10:39 UTC
From: Bob Naumann - W5OV
Topic: 1467 Message: 1668

I have to revise/correct my previous email.

I actually do have an auxiliary fan on my 2000A, but I didn't think it worked because it never ran - no matter what I did.

Until yesterday.

I was calling CQ on rtty at AA5NT into a relatively high swr antenna on 20m, and was putting out about 900w or 1Kw with about 300w reflected.

The temp was getting up around 90C or 100C according to the display. At one point, I heard the "roar" of a fan that I had not heard before.

It was my aux fan.

It ran a few seconds, the temp dropped to 80C and it shut off. Wow.

It does it's job, but - it has to be extreme for it to come on.

I tried and tried to get it come on again, so I could hear it with my headphones off, but it didn't.

Oh, and I also found that the amp keying output on a microHAM microKEYER handles the 2000A perfectly, and results in fewer switching errors than going directly from the FT1KMP amp key output. Nice value add of that device.

73,

Bob W5OV

Subject: RE: [acom-list] acom 2000a and aux fan

Krassy knows what he's talking about.

The amp is spec'ed out very conservatively, and protected very well.

Mine has been tossed around by baggage handlers between Antigua and Dallas 4 times for CQWW SSB operations and has been used in every major contest over the last 6 years or so back here in multi-ops at AA5NT - even on rtty.

No extra fan and it works fine.

Subject: [acom-list] acom 2000a and aux fan

While ordering my Acom 2000a, I told Krassy I wanted the aux fan. He said "for the health of the amplifier, do not put the aux fan on it."

He said the fan results in more dust being sucked inside, and after a couple of years, it amalgrams with the coils, and you just do not have as clean an environment as you would have without the fan.

Mentioning RTTY, etc. Krassy says heat is just not a problem for the amplifier - dust is more of an exposure. Since ACOM is supplying the 4 year warranty, how can I argue with that?

This is all a bit counter-intuitive to me. Comments?

Funny you mention that, Bob. Yesterday, for the first time ever, my
main fan went into "overdrive." I was on 17m RTTY calling 3Y0X (using
my 40m antenna). The temp was up to about 110C and I heard the roar of
the main fan. My aux fan runs all the time.

Bob, have you tried keying the amp using the outputs from Ft1kMP band data out socket. It works well with the inhibit keying cct in th Acom amps. I have the Acom 1000 here and also a 2000a on loan, it is fine with both. Chris G3SJJ

Hi Chris,

The article and diagram for hooking that up is sitting on top of the amplifier right now.

We got the microKEYER this week to simplify the radio/computer interconnections for all modes, and I found that it also solves the amp keying problem. I could always hookup the other connection, but this seems to do it quite well.

My amplifier is at AA5NT's station so I only see it during contests!

73,

Bob

OK Bob. I had the opportunity to use both systems last weekend in the FOC Marathon. I had the 2000a fed from Ant A socket and then into my main antenna system which includes verticals for 80 and 40. The 1000 was fed from Ant B socket into a trapped 80/40m dipole for close in stuff. I keyed the 2000 from the band data circuit and the 1000 from the MHam Keyer PA PTT output. I have fast rise and fall times set on the Router but didn't experience any problems on either system. It is all very good. 73 Chris

1673. RTTY & ACOM Great

Yahoo group: acom-list (1999 — 2009)

From: edctexas
Topic: 1673 Message: 1673

Not that anyone here needs to beat the drum for ACOM but this is the second test with the 2000a. I never got the kind of temps that you guys report. I can barely get 80C. There is about a 2C difference between Front and Back tubes. Don't think that is enough to worry about. The reflected power sure does make a difference in the heat generated. I just can't operate at full power on 75/80 because the SWR gets up there.

But this is a Great Amp. Helped with the 3Y0X QSOs too! The rapid band switch to go from RTTY contest to 3Y0X and back can't hardly be beat. And when the 80m antenna failed, the amp tripped off and saved itself. Pretty cool feature. Beats the old LK-550. Never need more than 40W output to drive and just quiet and cool. I hope the competition sticks with the other amps!

Ed...

Glad you're happy with your Acom!

I've had mine about 3 or 4 years now (?) and am still delighted with it. While I bought it for reasons of QRO, auto-tune, remote control, I think the way it self-protects itself is perhaps its best attribute. On numerous occasions, the self-protection has either pointed out a cable/switch/antenna problem I wasn't aware of, or made me look foolish because I was doing something dumb and the amp knew better than I.

73,

Dan

1675. Question regarding ACOM 2000A and 2000S(W) switch

Yahoo group: acom-list (1999 — 2009)
Date: 2006-02-17 13:25:16 UTC
From: Carsten Esch
Topic: 1632 Message: 1675

Hi,

is someone using this combination? I downloaded the online manual but have some problems to understand how it works ... How can you assign antennas to a band? What user steps are needed?

For instance

- ANT1 should be used for 20 and higher on port 1
- ANT2 should be used for 30m on port 2
- ANT3 should be used for 160/80/40m on Port 3

What are the needed steps that the switching is done automatically?

Thanks!

Carsten, DL6LAU

From: Guido
Topic: 1632 Message: 1676

The last antenna you select manually, will be the one switched automatically when you will return (and transmit) on that band.
Be careful that the 2000 switch works ONLY with 2000A powered ON and operating (not in stand by), because, like I said, it switches the antennas only after transmitting.

I use my 2000SW manually all the time with my 2000A powered down.

> I use my 2000SW manually all the time with my 2000A powered down.

Yes, of course, scrolling up and down with the two buttons...
I was meaning "automatically" and, in my opinion, for an item of this class,
it's an issue that the controller can't be interfaced with a TTL BCD output.

Hi all ACOM lovers,

Thanks for the private e-mails! Great info!

To share the info with others, it is the brand "Kilovac", type HC-1.

I ordered one by http://www.mgs4u.com/relay.htm . Used but in 100% OK condition as they promised / guaranteed me.

Vy 73, de Kees - pa7two - m5two.

1682. G2 Control Circuit Failure

Yahoo group: acom-list (1999 — 2009)
Date: 2006-04-08 12:27:34 UTC
From: Dave Hawes
Topic: 1682 Message: 1682

Today, after a period of inactivity of several days, I turned on the Acom 2000A. After the warm up timer expired, the motors turned in the amplifier and I got a "G2 Control Circuit Failure" hard fault, and the unit tripped off (power down). A second attempt to start up resulted in the same thing. On the third attempt (the charm?), the unit started up and stayed up, and appears to be working normally.

Does anyone have an idea of what happened, and why?

73 - Dave N3RD

1683. RE: [acom-list] G2 Control Circuit Failure

Yahoo group: acom-list (1999 — 2009)

From: Bob Naumann - W5OV
Topic: 1682 Message: 1683

Dave,

I don't recall if I had the same error message, but I did have a similar experience of intermittent behavior a few years ago.

The solution to my problem was to re-seat a socketed chip in the control head. I have not had that problem since.

Again, I'm not sure if this is the same thing or not, but it couldn't hurt to try.

73,

Bob W5OV

Well, if you find out what caused your problem, maybe we can find out what periodically causes my problem.
My 2000A is in the basement on a shelf mounted near the ceiling where all the coax lines come on the house. The RCM is in the shack. The amp is always plugged in and the power switch is always on. Every once in a while when I turn on the amp from the RCM, it kicks off after several seconds with a low bias alarm. To remedy this I unplug the amp for a few minutes. Then plug it in and everything is fine for maybe a month or two.

Hopefully it never gets worse than this.
N2TK, Tony

Topic: 1682 Message: 1686

Dave,

Let me know if you get any info on what is causing the problem with your 2000A. I have been having similar issues with my amplifier.

In my case, the amplifier sometimes displays "G2 voltage too low 20V" Sometimes it does not display anything, sometimes it just shuts down. After I start it back up, it operates normally.

From: Pat Twentythree
Topic: 1687 Message: 1688

Hi Hal,

I had the same problem and it was from my line voltage sagging below 220 volts. When the voltage went under 220 the heater LED came on and when it went back up over 220 volts it went off. I call ACOM and spoke to Will about it and he said not to worry the amplifier will operate with out any problems and that I would not damage anything.

1689. Bad Filament Connectors?

Yahoo group: acom-list (1999 — 2009)
Date: 2006-04-16 03:25:15 UTC
From: Hal Kennedy
Topic: 1689 Message: 1689

Traced my 2000A heater warning to low heater voltage and low heater current. 11.5V and about 3.4 amps. My second 2000A reads 13V and 3.7 amps. So, I guess I have the burnt filament connector problem. In looking through the amp tonight however, I've looked at the filament connectors and don't see anything obvious.

Can someone steer me to the connectors that tend to fail?

TNX,

Hal

1694. Acom 1000 24v fault

Yahoo group: acom-list (1999 — 2009)
Date: 2006-04-23 00:08:34 UTC
From: Frank J. Connelly
Topic: 1694 Message: 1694

Looking for some help.

Fired up the 1000 today after a few weeks of non-use. Received the following fault code: SB2E
The code shows up within two seconds after energizing the amp.

The full readout is:

1A SB2E 000000 000000
1B B193 0720DC DF6FE1

I know the SB2E is a 24v power supply error. Any help on what is causing it?

Thanks,
Frank-W7ND

Here is a follow-up to my own post.

I removed the bottom cover plate underneath the tube socket. There was quite a bit of dust in their as well as a couple of small dust cob webs between componets. After cleaning things up and blowing some canned air in there, everything is back to normal. My guess is that the dust and dirt was the culprit.

Even though the Acom 1000 manual says there is no need to ever open up the case for routine cleaning, I'd suggest doing it once a year. A foam filter on the air intake wouldn't hurt either.

Hi Frank,
I had to take apart my 2000A to replace a cap. I haven't had it apart for a couple of years, even though I use it often. I have been using a high density cut-up furnace filter on the external fan that was an option on my 2000A. I change the filter once or twice a year. Since I had it apart I took out the tubes to blow out the dust. Virtually nothing came out. I have used the external filter since I bought the amp 5 ? years ago. It is nice and clean inside the amp.

Subject: Re: [acom-list] Acom 1000 24v fault

Here is a follow-up to my own post.

I removed the bottom cover plate underneath the tube socket. There was quite a bit of dust in their as well as a couple of small dust cob webs between componets. After cleaning things up and blowing some canned air in there, everything is back to normal. My guess is that the dust and dirt was the culprit.

Even though the Acom 1000 manual says there is no need to ever open up the case for routine cleaning, I'd suggest doing it once a year. A foam filter on the air intake wouldn't hurt either.

1697. Re: [acom-list] heater led flashing

Yahoo group: acom-list (1999 — 2009)
Date: 2006-04-23 11:28:35 UTC
From: Bill NY9H
Topic: 1689 Message: 1697

since i fired it up this AM the heater LED is flashing...

13.3-4 volts on the fil-v and 3.7-3.8 on both F & R......

mains at 252...

If the control is displaying fil V on left & right the led does not flash....

amp appears to be operating correctly...

Thanks Tony. I'm afraid I spoke to soon. Turned the amp on this morning and the SB2E message/problem has returned.

Can somebody send me the excel sheet that has all of the error codes. Also, what is the best way to reach Acom? I presume phone is better than E-mail.

Of course this problem had to wait to surface until the amp was just out of warranty.

Thanks.

Frank

Try calling Will at (508) 359-5990 or email him will@.... He
was quick to respond.
If you get a list of the error codes, please pass them along or at least
post them to the group.

Tony

From: Bill NY9H
Topic: 1689 Message: 1700

I guess that it was telling me the line voltage was a bit too high,,,,

since it went to 246 all is fine , fil-v @ 13.1,,,& 3.7 amps,,,
guess 252 is too high,,,,

(I couldn't baby sit for this box better.....)

another thing I noticed,,,
there is rfi/emi coming off the control panel,,, it opens the sq on
my 2 meter talkie,,,, if i put it in the measure mode the freq
shifts a bit,,,,
(----computers !!!!)

tnx acom for a fine machine,,, CU at dayton

bill NY9H,,,,

1701. switch off behaviour

Yahoo group: acom-list (1999 — 2009)
Date: 2006-04-24 07:19:59 UTC
From: Thomas Herrmann
Topic: 1701 Message: 1701

Switching off my ACOM 2000A by RCU "Power on/off" botton (while main power at amplifier is still on), there are two different status, changeing from time to time:

- RCU LCD is bright and showing the Call with high contrast
- RCU LCD is off (dark) showing the Call with low contrast.

Switching off/on the main power at amlifier just for a moment, the RCU LCD remains dark. What is the correct behaviour ? May it be a question of main power voltage ? Should i switch the main power voltage range in the amplifier power supply ?

Thank You in advance for Your replays.

Hi --

Does a software tool exist to monitor an Acom 2000A's
performance, and turn it on/off?

I have the start of a remote-controlled station but am
not thrilled about transmitting without being able to see
what the amp is doing.

Thanks.

Mark,

The keying current requirement for the Acom 1000 is very low. 20 ma as I recall. There is an on-line manual in pdf format that you could doublecheck.

The 7000 should be able to handle keying without an interface that is often required of other amplifiers but, be sure to check your 7000 manual and confirm the keying current it will handle.

The only connections from your 7000 to the Acom would be the coax cable and a keying line. The Acom does not have ALC.

Again, read the on-line Acom 1000 operating manual at http://www.hfpower.com/. Lots of good information there.

1708. Re: [acom-list] Best dipole lengths

Yahoo group: acom-list (1999 — 2009)
Date: 2006-05-08 16:00:08 UTC
From: G3SJJ
Topic: 1708 Message: 1708

Mark, I think if that was available many trapped antennas and matching units would be made redundant!

I suggest three things :
- take the discussion off this Reflector is it is not really appropriate for basic antenna questions.
- buy a copy of EZNEC and model various antennas against different frequencies.
- join something like UK Contest Reflector where there is a wealth of technical knowledge for more general questions regarding antenna theory and practice.

As a starter, have you considered parallel dipoles? Why not just make up a 20m dipole and concentrate on that band for a while since it has been in very good shape recently compared to the other HF bands.

Chris G3SJJ

1710. acom2000 problems

Yahoo group: acom-list (1999 — 2009)
Date: 2006-05-11 13:47:28 UTC
From: on4iq
Topic: 1710 Message: 1710

After 2 days of not being active I switched on the acom2000 and the amp refuses to switch bands when applying drive.

Its stuck on 17m where it deliveres full output (so RF wise all ok) I've opened the amp and the steppmotor runs freely, bandswitch can be moved by hand and upon start up the stepp turn.

Its just the Rf freq ssensing that seems to be broken.

Having checked the diagram it the CPU print that does all the work.

Unfortunately the amp is out of warrenty.

Now the question: Has anyone experienced similar problems?
Is it feasable to go trouble shooting on the CPU board?

Is it time to look for another amp?

Johan
I would guess the problem in not in your amp but rather the controls. If you are using relays or cables to control the amp I would look there.
Keep Smiling,
Peter

1714. Acom 2000 For Sale

Yahoo group: acom-list (1999 — 2009)
Date: 2006-05-23 18:30:04 UTC
From: rrkpl
Topic: 1714 Message: 1714

I have an Acom 2000 in excellent condition for sale. I purchased it for my station in New Hampshire used it lightly for six months and then moved to a town house in the Atlanta area. Since being down here I have used it a few times set up for 117 volt operation at about
400 watts but kept getting into the neighbors appliances so it sits in it's box. I am asking
$4000.00 and would like pick up in the Atlanta area or I would drive a reasonable distance to
meet.

Guaranteed to work as new. I can be reached at 404-395-0292.

Richard/ N1VXW

1718. Acom 2S1 Commutator without TXINHIBIT

Yahoo group: acom-list (1999 — 2009)
Date: 2006-05-26 23:49:07 UTC
From: Jim Idelson
Topic: 1718 Message: 1718

Has anybody adapted the 2S1 to a pair of radios that don't have the TXINHIBIT or MUTE input? I believe this will require a separate box with relays to cut off cw, mic audio and ptt lines when the TXINHIBIT signal is asserted by the 2S1 box.

I will be operating at one of the multi-single stations in PY and want to use the 2S1 there without having to bring FT1000MPs. The radios at the station are an FT-920 and an IC-756 Pro II.

Any help here?

73,

Jim Idelson K1IR

I have an Acom 1000 amp for sale that I purchased new in the fall
of '04. I cannot run much power without irritating the neighbors so it
has been used probably less then 10 hours. I am asking $2,800 shipped
in the ConUS.
John K5XTX

1721. ACOM Tools Software

Yahoo group: acom-list (1999 — 2009)
Date: 2006-06-19 21:58:42 UTC
From: rolandguidry70578
Topic: 1721 Message: 1721

Is anyone using the ACOM Tools software that can be downloaded from the ACOM site to control their ACOM 2000a with software rather than the control unit? Any problems?

I would like to turn on the amplifier, connect to it and even auto tune if I need too, from my desktop position. The amplifier is sitting a good distance from my operating position, so it would be rather convenient if I could use the software.

Thanks in advance for the information

Roland NA5Q

Hi Roland,

I'm using the Acom Tools software to control my ACOM 2000 over a distance of about 150m, although I'm cheating slightly. The amplifier is installed in a small fibreglass hut close to the antenna and is hooked up to a PC (also in the hut) running Acom Tools. I'm then using TightVNC to control that PC remotely and operate the amplifier.

If you're going to try controlling the amp over RS232 with a distance of more than about 20m or so then you should look at buying a pair of long-line drivers (aka RS232 extenders) to boost the control signal.

Let me know if you need to know any further information,

Roland,

You can 'extend' the remote with a good quality RS232 cable. Maybe, even use RS232 repeaters/extenders and run it for hundreds of feet. I think there has been a discussion about this in the past, perhaps others can help if this is something you may consider.
Mel, K0PFX

(I just read Michael has the answer already!)

There are RS-232 to fiber optics adapters available at a reasonable cost
that will take you out to several 100 meters with no chance of RFI from the
amp.

Thanks to all for the info. Does the PC and software connected to the ACOM 2000a, replace the control unit that comes with the amplifier via serial connection? Hereby, I am only using the pc connected to the amplifier and the detachable control unit is store away.

Thanks,

Roland NA5Q

1726. Re: ACOM Tools Software

From: edctexas
Topic: 1721 Message: 1726

Its been a few months wince I last experimented with the ACOM tools. There are a number of limitations especialy wrt replacing the control head box. The RS-232 link runs relatively slowly at 1200 bd. This does place limits on what you can see wrt the power output and reflected pwr. You get the same info except there is a significant time lag.

The protocol used is fair obtuse. The interface to the ACOM tools code is very non-intuitive for one not used to the software used to create the tool software.

The two most difficult things about running the tools software are that once one starts it, the control head basically has no control like the control head can't turn the amp off. The tools software also can not shut the amp off. I believe that a separate means must be used to power the amp down. Now by power down I do not mean the "red light on the amp" off. The amp off function of the control head. I really wish that the RS-232 was done in a slightly cleaner fashion that would make the amp remotable say 100 miles away.

1727. ACOM 1000 Hard Fault Help

Yahoo group: acom-list (1999 — 2009)
Date: 2006-07-09 13:28:37 UTC
From: Kelly Johnson
Topic: 1727 Message: 1727

My ACOM 1000 is dead now with the following Auto-Protection Fault: PN0B. According to the manual this means: "output relay closed - (ORC, logic).

I have no idea why this happened or what to do next. This coincided with a loud pop sound from the amp so something must have blown. I only have a handful of operating hours on the amp and have never driven it hard. It's never been used for a contest or for a high duty cycle mode like RTTY.

Anyone else ever see this fault? What next? Factory repairs? Ugh!!!

1728. RE: [acom-list] ACOM 1000 Hard Fault Help

Topic: 1727 Message: 1728

Hi

After only a few hours use my Acom 1000 went bang, during a contest. Sadly I cannot remember the fault code.

Two of the high voltage decoupling capacitors had failed, at the point where HT enters the RF compartment. They're just inside. Their failure was obvious, from the scattered bits lying on the floor. That took out at least one fuse on the control board.

This may give you a clue as to where to start looking.

In my view this should be a feedthrough capacitor, but instead it's a feedthrough insulator plus ceramic disc caps. Not so good.

Good luck

John G4ZTR

Yes, I got a very quick response from Acom. I already sent it back to the USA Acom office.

I've been told that stuck or broken relays are a common problem, at least on the 2000's. Anyone know if this is true? It seems this may be a relay problem.

"where HT enters the RF compartment"? What is HT? Did you mean HV?

Sounds like mine may be similar.

I used to think the ACOM's were built like tanks and would take anything, but this sure changes my opinion. I have never run this hard. I've only used it when necessary to break pileups. No contests or anything. I don't overdrive it either. I'm clueless as to how/why this would happen.

Kelly

Yes, HV. The heavily insulated cable that enters from the right hand side (from memory).

I have a 2m Amplifier (not Acom) which was almost new and failed with a big bang during standby, so it seems that running it hard or not isn't always the issue.

I have had to replace a stuck antenna relay in my 2000A. It is a relatively difficult job, requiring removal of the front side of the case. Acom was very good in supplying directions and the relay!

The bang you heard was probably due to 'overvoltage' on a capacitor.
Having this occur during 'light load' is not so strange since the
voltage is highest when you just key the PA without applying drive.

Acom might have received a bad capacitor or a bad series of
capacitors, this can happen to anyone...

The QSK relay are worn out over time if you keep using it without
TX-inhibit. This is atleast very true for CW QSK operation!
http://la7dfa.com/ft-1000mp-qsk.htm

I have replaced the QSK-relay in my 2000A, and got a cheap surplus
relay for about 25USD.

Topic: 1727 Message: 1736

I opened the case to look for a blown capacitor, but didn't see anything obvious.

A friend of mine that owns an Acom 2000 told me last night that he has replaced a relay in his amp and another guy we both know has replaced his 3 times. This time I just sent it to Acom since it is still under warranty, but I'd sure like to know how to either prevent it or fix it next time. Returning it is expensive and time consuming.

I use TX-inhibit and CW QSK. I'll have to look into possible issues there.

You are correct. This is not appropriate to the list. An Acom amp for
sale - OK. A balun - no way.
There are plenty of places to list things for sale:
qth.com, eham.net, ebay, etc.
Please don't do it again, and no need for further discussion about it.

Phil,

If you are finding that it continues to work this way after powering it down, you might have taken a lightning strike or a substantial power surge. The switch controller and the switch have little blue capacitors that sometimes fail. But, I suspect you may need to send it in for repairs. Working inside the switch is very difficult. It is a complex design, both electrically and mechanically.

Jim K1IR

Jim

I remember they had some issues with the switch doing this very thing back 2003 and 2004 ,But I have been unable to find any of the old post on this subject. I not sure it took any hits power surge maybe position 1 I have a step ir on it 2 Big IR vertical 3, 4. were 80 meter loop and a w5gi dipole 5 palstar dummy load and 6 cantenna 7,8,9,0 have been un used since new the switch is mounted indoors at my ground box in the basement well grounded . I notice when I move the antennas too different ports they worked but they also would receive on position 5 which has a dummy load on it. I am thinking a wiper has gone bad . I give Wil and Krassy a call in the am . See if they have any ideas Thanks for your thoughts

You can bypass the reed relay in the Pro by taking the ground from the accessory jack, look on the din pin layout. One pin is grounded on xmit and it will handle the low current of the Acom 1000 relay.
I have used this arrangement but at only low speed qsk and had no problems but I dont know of anyway to use the qsk out jack on the 1000 to actually force the radio to send. I guess you could key the amp and then have the amp key the radio if you have hot switching problems.

==========

Subject: For Sale Acom Antenna Switch and Controller

For sale:

Acom 2000S remote antenna switch. Acom antenna switch is a remote 10 way antenna switch that handles up to 5KW. It is designed to work automatically with the Acom 2000 amplifier and can also be used in a manual mode or used with the RS232 serial port which can be custom controlled by your PC. Unit has never been used and is mint in the original carton including manual, RS-232 cable and control box. $600 plus shipping. Originally sold for $875. Weight is approximately 10lbs. I will provide pictures on request.

1758. acom 2000 low air flow alarm

Yahoo group: acom-list (1999 — 2009)
Date: 2006-10-18 14:30:17 UTC
From: kamarty456
Topic: 1758 Message: 1758

I have an acom 2000, put into service around September 2001. Recently I have been getting a "low airflow" alarm and the amp shuts down. I restart the amp and it works perfectly.

I do clean the external filter regularly. I really do not see any tube exhaust temperature issues either as after warm up I see 39--40C and I typically see the temperature go up evenly on long key downs in SSB mode...100-110c

Any of you experience a similar scenario? any suggestions?

Marty, ka7gkn

If it is heating up that much on SSB, you may want to clean out the inside of your amplifier also. It sounds like you have very restricted airflow.

Mine never gets that hot except on rtty during very hot weather.

1760. Re: acom 2000 low air flow alarm

Yahoo group: acom-list (1999 — 2009)
Date: 2006-10-19 14:22:32 UTC
From: edctexas
Topic: 1758 Message: 1760

I think Bob is correct. Mine never goes to 100C even during RTTY contests. I think it has reached 75C once during contests. It is also possible that something restricts the air intake or exhaust. Because I have a shelf above my 2000, I did have a problem when I was testing the installation. By adding a chimney with a boost extraction fan, I returned the temps to what they were prior to the shelf installation.

You would be surprised that a shelf mounted 4 in above the exhaust could cause an effect. I would not have even checked bu the manual said don't so that (so of course I had to see). Actually I needed to have the second computer's screen near enough for me to read so I needed the shelf. I'd make a couple of checks inside for dustballs if you don't have anything that even might restrict airflow.

Besides, the ACOM is one of the most quiet amps I have ever used and the moderate airflow in normal operation is one reason for that. Another idea is to either jury rig or buy the accessory fan. I believe the accessory fan mounts on the air intake in the rear and boosts the air going in.

Regards Ed KE3D

The only thing I wish the amp had was a faster warm-up. But if you cheated on that you'd shorten the tube life!

Hello everybody

I am having this failure on my Acom2000A.
When I try to switch it on , after 4/5 seconds it shout down with this message (heater voltage too low :2.37V)
Can You help Me to resolve this problem?
Many thanks.

Massimo

I was having a similar shut down I pulled the cover above the high voltage diode board there two contact cable that slides on too 2 pin contact on thein side of the top panel above the diode board. Mine was almost sliding off these pins ,and it does not have a keeper too keep the plug on the contact , i cleaned and re install the cable ,if your lucky this might be the problem.

I also believe that there was a batch of units which had defective connectors in the filament circuit. These connectors had a high resistance and caused low filament voltage. Some of the connectors actually deformed from getting too hot. So the advice to check the filament circuit connectors is good.

If you're unsure how to proceed, send the factory an email. You can download schematics and the factory can talk you through the check out in their email. It's not hard but if you are not sure of your troubleshooting, the factory would rather help than have the amp get returned.

Hope you get the problem sorted before the CQWWSSB! Good luck

Regards Ed KE3D

Hi, Massimo,

I had simmilar problems in two amplifiers ACOM2000A. Tubes heating curent
is too large and connectors are overheated. There are 3 connectors in
heating chain and one after one it have been overheated. I did throw it out
and soldered the wires in both amplifiers.

Subject: For Sale Acom Antenna Switch and Controller

For sale:

Acom 2000S remote antenna switch. Acom antenna switch is a remote 10 way antenna switch that handles up to 5KW. It is designed to work automatically with the Acom 2000 amplifier and can also be used in a manual mode or used with the RS232 serial port which can be custom controlled by your PC. Unit has never been used and is mint in the original carton including manual, RS-232 cable and control box. $600 plus shipping. Originally sold for $875. Weight is approximately 10lbs. I will provide pictures on request.

Topic: 1771 Message: 1771

Hello,

I purchased an new ACOM 1000 and have problems to get it running with my FT-990.

While giving a continuous CW signal for tuning I get the message **HOT SWITCHING**.

REMOTE output and the FT-990 internal relay is used for connect with ACOMs KEY-IN.

The cable comes from my ACOM dealer.

Any help is very appreciated.

Hello again,
I have cut off all the molex connectors (the white ones), even tough there were not mark of overheating. Soldered the wires diretcly on the lv board.
Now my Acom2000a works again.
Still , I read on the remote control unit that the filament volts is still a little bit too low. about 10.6 v 10.9.
But Ithink it is a problem on the Analogic interface PCB.

Thanks to All
Massimo

Be sure your line voltage jumpers are set correctly

A low line voltage or incorrect setting might
result in that error

Massimo,

I concur with Dennis. I had a similar experience. As soon as I re-strapped my 2000 for a lower than expected line voltage, the "heater voltage too low message disappeared".

1775. Re: acom 2000 low air flow alarm

Yahoo group: acom-list (1999 — 2009)
Date: 2006-10-31 15:40:22 UTC
From: kamarty456
Topic: 1758 Message: 1775

just a follow up to my original posting.

I finally went through the delicate/arduous task of removing the 2000A cover. The inside actually looked quite clean, the circuit boards did not even display a light coating of dust.

I did note the silver coils did darken in some areas. I'm in Arizona so salt air or high humidity are not an issue.

I then took the air hose and began to blow out what I thought was a clean chassis! I did have two large dust bunnies fly out around the high speed fan cooling the tubes. The squirrel cage did have some dust on it. I ran about 80psi of air pressure.

I took my time and hit the innards in many directions to ensure any dust is blown away. I then waited for the cloud to settle and repeated the action.

I then ran the amp for a day with the cover set to cover the safety interlocks. Yeah dangerous..but the amp sits 10 feet from the operating position. The results were all temperatures normal.

I then replaced the cover and gently replaced the screws..no torquing here!!!!

All seems to be working well as the initial warm up temperature is between 30-40C and after long SSB cycles I run 60-100C. These numbers are my "normals". I suspect the back of the amp sitting only 3-4 inches from the wall there may be an air flow issue. I'll determine if I can move the amp further out to improve the air flow.

The idea of adding fans to the chimneys does sound clever but how much noise was introduced into the mix?

Thanks to those who replied to my original message

Egads 60-100C for SSB?

I never saw anything above 60C even when running RTTY contests at full legal output power. That is without the aux fan.

Look for some more dust bunnies.

For SSB with extended xmit (like CQing in a contest with short breaks to listen) I've gone up to 70-80C. It's probably related to increased duty cycle of the speech processor. Brian, you're right about RTTY, in that it goes no higher than 80C. BTW, I do have the accessory fan on the back air input.

Marty,

That's about average for me too. If you run a SSB foot switch for transmit, you'll see the amp upwards of 90 degrees on long transmissions (like you do too). Don't worry about it. Krassy told me it's no issue for the amp to run like this.

From: Daniel
Topic: 1779 Message: 1779

Hi folks

Ist it really up to date, to buy/have an "old fashioned" tube-PA? Today? We have so many good solid state PA's?

Or are there any other good reasons to buy/have a tube-PA?

Because I'm thinking over to buy/have a ACOM 1000 or SPE EXPERT 1K-FA or THP HL1,5KFX..
So I "need" some godd points

Daniel, HB9DDS

How about the 70-100 amp supply and the hefty power cables being a
negative. Personally, I don't want any of those arc welders in the
shack. Consider the effect of the magnetic field of that DC current
on surrounding objects.

How about the ability to handle 3:1 SWR's at full power? Haven't seen
a 1.5KW ham amp that can. On the other hand ACOM's tube amps do

Hello Daniel

I'd go for the Acom 1000.
I am using it for rtty contesting most of the time
and believe me they can handle some serious work
and are a real pleasure to use,besides it will save you over 300 euros.
Give Ron at Vinecom a call and you will be convinced no doubt.

Subject: [acom-list] Old fashioned Tube PA today???

Hi folks

Ist it really up to date, to buy/have an "old fashioned" tube-PA? Today? We have so many good solid state PA's?

Or are there any other good reasons to buy/have a tube-PA?

Because I'm thinking over to buy/have a ACOM 1000 or SPE EXPERT 1K-FA or THP HL1,5KFX..
So I "need" some godd points

Daniel, HB9DDS

Daniel, I have checked and compared for over 2 years and finally bought an ACOM 1000.

You can't go wrong I think - not the cheapest maybe but it keeps on going (48hrs 1kW contesting). It is very solid and well protected. I have pulled some nasty tricks when falling half asleep in the middle of a contest but the amp is well protected and very forgiving.

Also: tube is cheap, matched pair(s) of MOSFET = expensive!
Tuning is not an issue: I have made a table with values per band / antenna and it takes 3 seconds max to QSY and be on the air.

I chose the ACOM 1000 because it has so many good references. You can add mine to that.

Nearly silent operations. Very cool operations. Still works at 3:1 SWR. Lots of headroom. Only downside is the 2 minute warm-up period. I'm sure the THP is a good product but the ACOM 1000A is incroyable

FWIW, I have an FL7000 solid state amp (600 w) and an ACOM 1010. The FL7000 is gathering dust because it has a hair trigger shut-down on 80 and 160 at very low SWR ratios. Instant-on and no-tune are nice features, but not enough to make me prefer the solid state amp.

Thanks for all replay's

"... Still works at 3:1 SWR..."

Some of the solid state amplifiers have an internal automatic antenna tuner. So the can handle this SWR and higher!

More inputs?

Yo,
I bought an ACOM 1000 right before we went to FT5XO. We abused it on 6M EME and primarily the low bands as we needed a bit of extra ooommph there. The amp worked so well that I bought a second one so that we had two of them on our recently completed ZL8R overnighter. Both amps were worked pretty hard for a week straight with varying voltages from our generators. The second amp had a few of its illumination lights on the display quit although the older amp had no such problems. Will, at ACOM, has been very responsive so far to the problem and I am pleased with the after-sales support shown.
My elderly home Alpha 77 has been showing signs of its age recently so am investigating the 2000A..based solely on the excellent functioning of the 1000.
73 and I remain,
Lew W7EW/W7AT

Hi Daniel:

I have no dog in this fight. Do as you wish.

But all of those files contain copyrighted information and it is a violation of copyright laws as well as Yahoo's policy to post them unless permission from the copyright holder has been received. The fact that there may be other copyright violations in the files means only that others have done as you have. Probably the worst that can happen is that the ARRL complains to Yahoo and Yahoo then removes the files.

Have a good weekend.

1798. A1010 fan noise

Yahoo group: acom-list (1999 — 2009)
Date: 2006-11-11 22:11:12 UTC
From: Andy Hamon
Topic: 1798 Message: 1798

Guys

I own an A1010 and have used both A1000 and A2000 amps, so can give a "side by side" comparison.

I have to admit the fans on the A1010 do generate a bit more noise that the A1000 or A2000 but not anything near the same level as older 3-500 based machines.

I mentioned the noise from the A1010 fans to the guys at Acom, who quickly provided a mod to quiet things down. I confess that I have not carried out the mod myself but hear it does make an appreciable difference. All new build machines have the mod included.

These are my comments and observations based on an A1010 purchased August 2005.

1799. ACOM 1000 output spikes at start of transmission

Yahoo group: acom-list (1999 — 2009)
Date: 2006-11-12 16:50:08 UTC
From: pa7two
Topic: 1799 Message: 1799

Hi to al ACOM lovers,

I noticed some behaviour I did not saw before during this weekend
while chatting in SSB.

When I set the power_output of about 35 watts or so on my TRX, and
press the PTT key, SSB modulation, I see a huge output power spike on
scale of the ACOM 1000. Full power on the scale at first, then to
normal level 600-650 watts.
I used my FT1000 MK V and a KWD ts570DSG and with both radios I
observed this behaviour. In CW/FM all is OK, just a slightly higher
output at the start of PTT but that's just one segment on the ACOMs
display and I suppose it is normal since HV is its highest at start of TX.

If I repeat the PTT on my radio quickly after each other, no spikes
noticable. Only when I leave the radio in RX for 5-10 seconds and then
push the PTT and start talking.

Is this normal behaviour?

Looking forward to your replies,

73, de Kees - pa7two

Kees,

I use an Icom 746 to drive my ACOM 1000. The 746 is know for a large spike on start of SSB transmition. The transceiver spike drives the my ACOM to several hundred watts upon keying the mic. I do not notice it in CW.

I don't know the FT1000 but you might check it for a spike on ssb transmit.

Sadly, this is a problem with many transceivers. It is not a problem with your Acom, the amplifier is doing just what it should, and it is amplifying what comes from your drive rig. What comes from your rig is full power, just for a moment, while the alc catches up and cuts back the power to whatever you have set it at. So, from most rigs that will be 100w for the first few milliseconds.

I use a TS2000. It's better than some in this respect, but still not perfect.

Hi Bob,

Yes, from the ICOM radios I knew about start of Transmission spikes,
but not from a KWD nor Yaesu FT1000MP MK V... I never have noticed
this because I hardly use SSB you see, mostly CW these days for me.

Your ACOM amp is fully happy with the several hundred of spike watts?

Let us see what the others say, I am very much looking forward to read
more replies!

Vy 73, de Kees.

Kees,

Well, the ACOM seems happy as long as it is fully switched to the transmit mode PRIOR to getting the spike from the transceiver. Not meaning to run an advertisement here, but I use a MicroHam unit that will introduce a variable amount of transceiver keying delay to allow a power amplifier to make a switch from standby to transmit prior to getting the transceiver power. My delay is approximately 50 ms. Much less than 50 ms and the amplifier does do the Hot Switch alarm on transmit. As I recall the ICOM 746 has a several hundred milliseconds burst beginning and end of transmission.

So, as you say, it will be interesting to see what others have to say.

Hi OM Bob,

Thanks for your replies.

I wonder if the ACOM likes the spikes in case where the AMP is not
(fully) tuned and we hit the PTT on our rigs.
I mean, a 100 or even 200 watts spike in a not tuned amp, or even a
100 or 200 watts spike in a normally tuned amplifier, it cannot be
good right?

73, de Kees.

1805. RE: [acom-list] Re: ACOM 1000 output spikes at start of transmission

Yahoo group: acom-list (1999 — 2009)
Date: 2006-11-13 13:23:13 UTC
From: N2TK, Tony
Topic: 1799 Message: 1805

I had this type of problem years ago with a TS930S. When I used the relay output to key the amp I would sometimes get a large RF spike out of the amp. So instead I used a signal on one of the connectors. I think it was a 12V signal when the RF was ON. The rise time of this was faster than the relay. It seemed the rig was putting out RF before the transmit relay's contacts were closed. I used this signal to turn on a power mosfet, which in turn keyed the amp. That seemed to solve that problem.
Since then I have been not been using the internal rig's relay to key the amp. Instead I look for a signal on the rear panel of the rig that is faster them the relay to key a power mosfet.
I don't know if this is the same type of problem you are seeing. Does the 746 put out the spike of power when it is running barefoot?

Kees

Sadly, this is a problem with many transceivers. It is not a problem with your Acom, the amplifier is doing just what it should, and it is amplifying what comes from your drive rig. What comes from your rig is full power, just for a moment, while the alc catches up and cuts back the power to whatever you have set it at. So, from most rigs that will be 100w for the first few milliseconds.

I use a TS2000. It's better than some in this respect, but still not perfect.

Kees,

I use an Icom 746 to drive my ACOM 1000. The 746 is know for a large spike on start of SSB transmition. The transceiver spike drives the my ACOM to several hundred watts upon keying the mic. I do not notice it in CW.

I don't know the FT1000 but you might check it for a spike on ssb transmit.

HI folks

I've tested a little bit my new 1000 this evening on a dummy load to get any routine for tuning. It's easy, very easy. Really.

So I have to questions:

-Is there also a counter in the 1000? If YES, how can I activate it?

- I have a TS-2000 where I can reduce the power from 5W to 100W in 1W/5W steps. I have also a TS-520SE but there I can't reduce the SSB power from 120W. The ACOM-1000 has no ALC input or so. How can I solve this "problem"? Thats only on my TS-520SE when I would NOT use the full output power!

Daniel,

Can't you use the mike gain control?

If I recall on the TS520 series, the carrier level control adjusts the
CW output level and the mike gain adjusts the SSB level.

Hi Brian

".. If I recall on the TS520 series, the carrier level control adjusts the CW output level and the
mike gain adjusts the SSB level..."

For CW it is OK, but for SSB it is not a good idea to adjust the level with the Mic gain. The
more lauder you speak the more power goe's out. I think the only way ist, to give a voltage
voltage into the ALC connector of the TRX.

Bill,

I'd suggest looking at your coax, connectors and antenna first. My personal experience with arc faults have all ultimately been caused by something other than the amp. Flaws that may not have been evident with another amp show up very quickly with the 2000. Its protective circuitry does its job well.

Bill,

The Acom is very sensitive to antennas that have problems. More than likely your antenna has a problem even though the swr looks ok and no problems with another antenna. Check for loose connections or connectors. There is a possiblity that RF is getting back into the shack. If you feel this is the case, make a simple choke. 10 turns of RG-8 on a 3" form should help. DX Engineering make some real nice baluns for high power, although they are a bit pricey.

Bill:

Several people have given good advice regarding your arc fault situation. I've found that if the Acom throws errors at you, it's usually correct & protecting itself from something you can't see. If, after checking your entire antenna network (isolate tuners, coax switches, SWR bridges, and other "innocent" hardware in the 160/80M line) you still get the error, you might want to retune the Acom on each of your band 160/80/40M segments (see manual).

As to "innocent" devices, I had a pricey & high quality coax switch with gas tube surge protector that turned out was causing arc faults on the Acom. The switch "worked perfectly", had good isolation, the gas tube was OK, etc., etc. Out of stubborn faith I refused to to remove it from the line (it switched antennas from a doublet on 160/80/40 and a log periodic above 14 MHz). Like you, I kept getting arc faults only on the low freqs. Everything was working fine. Finally, out of desperation, I removed the coax switch, and no more problems. I still don't know why that switch was causing trouble, but the Acom is happy again, and that switch is no longer in my inventory.

Good luck & 73

Hi Bill...

Well lots of luck. Wish I had the Silver Bullet for you, but I'm now tapped out on ideas.

I can tell you, however, that having had some of these arc-fault problems, and being in touch with several Acom owners, the amps have ALWAYS been right so far! Humbling, but it seems to make everyone happy that their expensive investment is protecting itself.

Might be time to contact Krassy or Will or one of the other guys at Acom?

Good luck & 73

Dan

You could have arcing in any one of those very numerous connectors on your cross connect panel.

Use a piece of coax from the amp's output directly to the antenna's feedline and test it that way to eliminate all of that stuff from the RF path.

Thanks Bob, for the comment...

I did "insert" the amp after all the switching stuff, as you
correctly suggested , same exact problem. and it is alot of stuff !!!!!

i'm going to the yard and check on the actual radiator....

tnx & Happy Thanksgiving to all....
(If we are lucky enough to have the loot for an ACOM , we are ALL
fortunate and have a lot to be thankful for :) ....

You don't have to worry about hurting the amp by activating that arc fault protection. It shuts the amp down well before anything bad can happen. You can feel comfortable exercising it as much as necessary to track down the bad connection or relay.

I've found that if the Acom throws errors at you, it's usually correct &

protecting itself from something you can't see. If, after checking your entire antenna network (isolate tuners, coax switches, SWR bridges, and other "innocent" hardware in the 160/80M line) you still get the error, you might want to retune the Acom on each of your band 160/80/40M segments (see manual).

>As to "innocent" devices, I had a pricey & high quality coax switch with gas tube surge protector that turned out was causing arc faults on the Acom. The switch "worked perfectly", had good isolation, the gas tube was OK, etc., etc. Out of stubborn faith I refused to to remove it from the line (it switched antennas from a doublet on 160/80/40 and a log periodic above 14 MHz). Like you, I kept getting arc faults only on the low freqs. Everything was working fine. Finally, out of desperation, I removed the coax switch, and no more problems. I still don't know why that switch was causing trouble, but the Acom is happy again, and that switch is no longer in my inventory.

Use a dummy load to identify the antenna/feedline component that is causing the fault between the amp's SO-239 and the antenna. First confirm that there are no arc faults with the dummy load connected directly to the 2000A, and then proceed either outward to antenna or work back from antenna toward shack with the dummy load.

Subject: [acom-list] For Sale Acom Antenna Switch and Controller

For sale:

Acom 2000S remote antenna switch. Acom antenna switch is a remote 10 way
antenna switch that handles up to 5KW. It is designed to work automatically
with the Acom 2000 amplifier and can also be used in a manual mode or
with the RS232 serial port which can be custom controlled by your PC.

Unit has never been used and is mint in the original carton including
manual,
RS-232 cable and control box. Asking $600 plus shipping. Originally sold for
$875. Weight is approximately 10lbs. I will provide pictures on request.

Hello All,

I had my 2000A on and running for 48 hours
in the CQWW CW contest.
Toward the end of the second day I noticed
the output power was down to about 600 watts
on 20,15, and 10 meters. Other bands seemed okay.
I had to turn the drive all the way up to 100 watts to
get about 1200 out of the 2000A. With that much drive
I was getting the "PLATE" and "DRIVE" lights lighting on
the 2000A!!! All Antennas are fine!!

Any ideas and/or suggestions???

Thanks in advance for any help...

73,
Ted K2QMF

When my lights start coming on like that, something in the
loading gets out of kilter

I do the Manual Band Segment tune Procedure and all is well again

Put anp in "Operate"

Press "Enter" twice

Adjust power to amp so cursor goes within the bracket symbol

Amp will then give you an "OK" type mesage.

Try that and let me know if that works

FCC MODIFIES AMATEUR RADIO SERVICE RULES,
ELIMINATING MORSE CODE EXAM REQUIREMENTS AND
ADDRESSING ARRL PETITION FOR RECONSIDERATION

Washington, D.C. ☐ Today, the Federal Communications Commission (FCC) adopted a Report and Order and Order on Reconsideration (Order) that modifies the rules for the Amateur Radio Service by revising the examination requirements for obtaining a General Class or Amateur Extra Class amateur radio operator license and revising the operating privileges for Technician Class licensees. In addition, the Order resolves a petition filed by the American Radio Relay League, Inc. (ARRL) for partial reconsideration of an FCC Order on amateur service rules released on October 10, 2006.

The current amateur service operator license structure contains three classes of amateur radio operator licenses: Technician Class, General Class, and Amateur Extra Class. General Class and Amateur Extra Class licensees are permitted to operate in Amateur bands below 30 MHz, while the introductory Technician Class licensees are only permitted to operate in bands above 30 MHz. Prior to today's action, the FCC, in accordance with international radio regulations, required applicants for General Class and Amateur Extra Class operator licenses to pass a five words-per-minute Morse code examination. Today's Order eliminates that requirement for General and Amateur Extra licensees. This change reflects revisions to international radio regulations made at the International Telecommunication Union's 2003 World Radio Conference (WRC-03), which authorized each country to determine whether to require that individuals demonstrate Morse code proficiency in order to qualify for an amateur radio license with transmitting privileges on frequencies below 30 MHz. This change eliminates an unnecessary regulatory burden that may discourage current amateur radio operators from advancing their skills and participating more fully in the benefits of amateur radio.

Today's Order also revises the operating privileges for Technician Class licensees by eliminating a disparity in the operating privileges for the Technician Class and Technician Plus Class licensees. Technician Class licensees are authorized operating privileges on all amateur frequencies above 30 MHz. The Technician Plus Class license, which is an operator license class that existed prior the FCC's simplification of the amateur license structure in

1999 and was grandfathered after that time, authorized operating privileges on all amateur frequencies above 30 MHz, as well as frequency segments in four HF bands (below 30 MHz) after the successful completion of a Morse code examination. With today's elimination of the Morse code exam requirements, the FCC concluded that the disparity between the operating privileges of Technician Class licensees and Technician Plus Class licensees should not be retained. Therefore, the FCC, in today's action, afforded Technician and Technician Plus licensees identical operating privileges.

Finally, today's Order resolved a petition filed by the ARRL for partial reconsideration of an FCC Order released on October 10, 2006 (FCC 06-149). In this Order, the FCC authorized amateur stations to transmit voice communications on additional frequencies in certain amateur service bands, including the 75 meter (m) band, which is authorized only for certain wideband voice and image communications. The ARRL argued that the 75 m band should not have been expanded below 3635 kHz, in order to protect automatically controlled digital stations operating in the 3620-3635 kHz portion of the 80 m band. The FCC concluded that these stations can be protected by providing alternate spectrum in the 3585-3600 kHz frequency segment.

Action by the Commission on December 15, 2006, by Report and Order and Order on Reconsideration. Chairman Martin and Commissioners Copps, Adelstein, Tate, and McDowell.

1833. lo-airflow fault anyone else experience this?

Yahoo group: acom-list (1999 — 2009)
Date: 2006-12-21 03:57:12 UTC
From: kamarty456
Topic: 1833 Message: 1833

I have an Acom 2000A. back in November I started to experience intermittent lo-airflow faults. I contacted Will at Acom and I ended up sending a written letter via the postal service as he never seemed to receive my E-mails.

He spoke with me on the telephone today December 20th and basically he wants me to ship the amp back to him. Well not this time of season will I ship an amp from Phoenix to Mass.!!!!!

I have the schematics and will pop the cover in the next few days. I truly do not think it is an electronic problem. If it were a component failure the amp would always fault. I can get the amp to run and cool properly sometimes on the first turn on and sometimes after 6 attempts.

Oh, I have this amp since Sept 2000 and have a bit over 2500 run hours.

So my question to the group is...has anyone else experienced this fault? and what was the fix.

I will close by saying the inside of the amp is spotless. I also clean the filter every 8+ weeks as it's dusty in Arizona.
I blew out the amp and did clear out one large dust bunny by the squirrel cage. Otherwise I'm open for any suggestions.

Thanks
Marty ka7gkn

Hi Marty,

I am sorry that I don't have the answer to your query but I think
you are on the right track on your thoughts for troubleshooting.

I have a 2002 model with lots of contesting hours on it
and wxcept for an occaisional arc fault due to some tempermental
antennas I have never seen the one you mention.

Yes, you are wise NOT to ship anything til the Xmas smoke clears !

BTW, can you tell me what phone number you finally
were able to contact Will at ACOM on ??

From: Robert Naumann
Topic: 1833 Message: 1835

Marty,

I think that the majority of problems that many of us have experienced are failures in connectors, or some sort of metal to metal connection oxidation in the amplifier. These are all long term mechanical component failures.

Look at connectors and connections. One problem that I found was inside the remote control head. There are some connectors and I think a chip in a socket in there. Carefully remove and re-seat them. This solved a problem I was having a while back.

Then, if you don't find the problem, and when you think it is safe, ship it to Will and he'll fix it immediately and return it to you promptly. I would suggest sending it using Fedex or UPS overnight no matter when you do it. If you shipped it Thursday, they'd have it today - Friday by 10AM - even during the busy season. Yes, it costs a little more, but think about how much the amp would cost to replace. The value of the dollar is down against the Euro, so it would be even more expensive now than what it was previously.

Remember to remove the transformer and not send it when you ship the amplifier and remote control head.

73,
Bob W5OV

Subject: [acom-list] lo-airflow fault anyone else experience this?

I have an Acom 2000A. back in November I started to experience intermittent lo-airflow faults. I contacted Will at Acom and I ended up sending a written letter via the postal service as he never seemed to receive my E-mails.

He spoke with me on the telephone today December 20th and basically he wants me to ship the amp back to him. Well not this time of season will I ship an amp from Phoenix to Mass.!!!!!

I have the schematics and will pop the cover in the next few days. I truly do not think it is an electronic problem. If it were a component failure the amp would always fault. I can get the amp to run and cool properly sometimes on the first turn on and sometimes after 6 attempts.

Oh, I have this amp since Sept 2000 and have a bit over 2500 run hours.

So my question to the group is...has anyone else experienced this fault? and what was the fix.

I will close by saying the inside of the amp is spotless. I also clean the filter every 8+ weeks as it's dusty in Arizona.
I blew out the amp and did clear out one large dust bunny by the squirrel cage. Otherwise I'm open for any suggestions.

Thanks
Marty ka7gkn

Had this on my Acom 1000A and don't know if that could be related to your issue with the 2000? Please see message 1278, basically faulty tacho unit on the main blower which tells the amp that the blower is rotating.
Amp sent away in 2004 as it was brand new and replacement arrived soon after once fault was verified as being genuine..
Best of luck, Merry Xmas to all!

1837. Re: lo-airflow fault anyone else experience this?status update....

Yahoo group: acom-list (1999 — 2009)
Date: 2006-12-24 20:35:32 UTC
From: kamarty456
Topic: 1833 Message: 1837

I did receive a detailed e-mail from Stanimir, an Acom engineer.

He provided some insight and a number of photos. Of course with it being this time of season I'm unable to dive into this anomaly as I'd like to.

I did pop the cover and verified the inside is clean. I fired up the amp and it again took about 6 attempts to get the amp to run and not fault low airflow. Once running, I ran from 300-1.5kw for over an hour on SSB and not a single hiccup.

This makes me consider the following:

1. the motor and squirrel cage are just fine. By the way, I do not have the 120vac style blower motor. I believe the rpm of the motor and squirrel cage are also just fine.

2. I suspect with 2500+ run hours and being a 6 year old amplifier the tolerances of the components may have drifted. Thus the low airflow set point may be at a critical setting. Stan did explain there is an adjustment. For now though it will have to Wait as access to the bottom of the amp is difficult. I will need some uninterrupted time and attention to get to the adjustment etc. Then, just a tweaking of 1-2degrees will settle down the alarm.

For the Ham asking what phone number to Acom I used? It's:
1-866-533-2266

I'll report back as progress is made

1838. Acom 1000 mains board blown fuse

Yahoo group: acom-list (1999 — 2009)
Date: 2006-12-30 13:19:32 UTC
From: Jorge A Mejia
Topic: 1838 Message: 1838

While on stand by I had F2 blown on the mains circuit board (250V 2 Amps) I received some basic instructions from Stan at Acom but it all looks fine. I replaced the fuse and same thing it blows right away.

Has any one experienced this situation ? Acom service is a long way from here so I must troubleshoot this myself.

I'd very much appreciate any suggestions

Jorge HK4CZE

1839. PC control of the amp

Tod, K0TO, is interested in creating a program for PC control of the amp. Acom-Tools is buggy and leaves a lot to be desired, and Acom seems to have no interest in providing any updated software.

If anybody on the list has experience with assembly language programming and/or PIC programming experience, please contact Tod at tod@....
He prefers not to join the list due to some previous problems with spam he believes came from yahoo.

Tnx,
Barry W2UP

1844. Re: lo-airflow fault status update....

Yahoo group: acom-list (1999 — 2009)
Date: 2007-01-05 01:46:34 UTC
From: kamarty456
Topic: 1833 Message: 1844

I want to report my Acom 2000A is doing just fine!

I opened the amp up and followed the instructions from Stan.
I also opened up the bottom panel under the tubes. I found a grimy
dust on the air flow circuit board and the resistor.

I carefully blew off the dirt, and used a soft brush to remove what
dust was "stuck" on the panel.

I fired up the amp and it required 3 tries in adjusting "RP1" on the
air flow circuit board.
I was not given any measurement points or values. I was simply told
to rotate the pot one or two degrees.
I carefully made the adjustments and on the third "tweaking" success!

The amp is back together, the amp starts up just fine, and on the
first try. The running temperatures are within parameters etc. etc.

I have about 10+ hours of run time since making the adjustment.

I conclude that the RP1 setting was within a critical point and due
to changes in the amp from age, 6 years, and run time +2500 hours,
some tolerances may have changed enough to cause the problem.
Adjusting the pot returned the amp back into the operating window.

A huge sigh of relief here as I really did not want to ship the amp
from Arizona to Massachusetts, at least not this time of year!

Thanks ACOM for your support.

Marty, KA7GKN

Hello,

Maybe someone has a clue what to look for.

Fuses F5 or F6 on the MAINS CONTROLER board blow as soon as the RCU starts powering up the amp. All lights on the RCU light up, and as soon as the count-down should start, everything shuts down.

Any idea?

I thought I'd send this again, to keep it fresh.

There should be software as elegant as the product.

As a "competitive" issue, if the control software IS important...
then the new Alpha will certainly take away sales from the
ACOM. Maybe ACOM will do it ?????

1849. Acom tools

Yahoo group: acom-list (1999 — 2009)
Date: 2007-01-18 16:41:34 UTC
From: Eric Scace K3NA
Topic: 1849 Message: 1849

I wonder if others are experiencing the same issues listed below...
or if I have a configuration issue.

My most persistent problems with Acom Tools is keeping the amp happy
when the serial cable is attached to the computer serial port. The
problems include:
-- Achieving initial synchronization between Acom Tools and the amp.
The only way I can reliably do this is to start with the serial cable
disconnected... power up the amp to the standby state... start Acom
Tools (pre-configured for the correct serial port)... and then attach
the cable. At this point the Tools will establish communications with
the amp and can reliably switch the amp between Standby and Operate.
-- After a fault, the fault indicator in Acom Tools stays
illuminated. The fault can be cleared by returning the amp to Operate
from Acom Tools... but the indicator in the software remains on.
-- If one logs off and powers down the computer, or restarts the
operating system, all bets are off. When one gets logged back on and
restarts Acom Tools, the chances seem excellent that Tools will not be
able to communicate with the amp. Worse, the amp's physical control
panel's communications with the amp are also confused. One has to power
cycle the amp, and go through the whole remove-the-serial-cable/start
up/reattach-the-cable process again.

I haven't even attempted to control two amps on the same computer,
nor implement an interface to power-cycle the amp.

This makes Acom Tools pretty marginal for remote control. Right now
we're forced to leave the amp on standby if we want to run the station
remotely, which consumes a lot of power (but keeps the shack warmer in
winter). A site visit is required if electric service gets interrupted
or any of the above glitches occur. Fortunately, we've never seen a
problem where the amp gets locked up in transmit mode.

The computer is running WinXP Pro SP2, and the amp is an Acom 2000A.

Eric,
I've been on Acom's case about Acom Tools for years. I spoke with the
author of Acom Tolls a few years ago about some of the problems.
Unfotunately, they had some "miscommunications" and no longer work
together.

For me, it works fine with Win98, but is very flaky with WinXP. When I
run Writelog and Acom Tools in a contest, the amp switches frequencies
correctly, getting the frequency data from the radio before xmitting,
but the real-time power bar graphics just randomly bounce around on the
screen.

For a high-end amp like the Acom, I expect better support, whether
hardware or software, but unfortunately expectations exceed reality.

Hello Guys
It would be cheaper for you all to simply purchase an Alpha 87A. The 87A software works great on Windows XP and is easy to integrate into control software.

I sold my Acom about 18 months ago - nice amp - but the control software was virtually useless

Cheers

That, and the fact that ACOM is forgiving in bad SWR situations,
less expensive
and has a very clear user interface, no funny LED codes but plain text.

The new Alpha 9500 is interesting no doubt, but is it really competitive????

Until now nobody knows....

I owned a Acom 1000 who was working without problems with a swr worser
then 1.3 (25 % refl.),i think if a pindiode-amp like a 87a likes
that......
Do you have also a Acom 1000 or a 2000, Eric ?
We did business a few years ago with a very nice Yaesu 2100Z that you
sold to me.
Now i use a Acom 2000a with a lot of pleasure.

Hello Hans - all agreed re the Acom advantages (that is why I purchased the Acom 2000 to start with)

The software is really only important for those of us who are using remote station installations - and for this application the Acom 2000 is very poor (because of the control software deficiencies)

87A tubes are expensive - but on the other hand I did blow 2 tubes in my Acom (could have been unlucky) - whereas the 87A (a used unit) has perfomed flawlessly. Could suggest 87A tubes are more reliable and long lasting thus justifying their higher price.

That said - I would still be happily using the Acom 2000 if not for its software deficiencies

Cheers
Paul (vk3ajj)

I own a ACOM 2000 since abt 3 years, flawless performance...

If only someone with programming skills would revamp the software....

Having said that, I don't really need remote control....

1859. additional cooling fan????

Yahoo group: acom-list (1999 — 2009)

From: kamarty456
Topic: 1859 Message: 1859

When you consider buying the Acom 2000A you are aware that there is an optional muffin fan available.

When I bought my 2000A back in 2001 I was told for SSB I do not need it.

I just wonder how many Acom 2000A users have installed the optional cooling fan and what types of temperatures do they experience?
Then, how about noise? how much more noise does the muffin fan add to the total noise the 2000A generates.

I estimate without the additional fan I see a noise level around 54DbSPL "C" weighting. I used a Radio shack 33-250 SPL meter.

Hi Marty,

I have have the optional cooling fans on my 2000A. When I ordered the amplifier I also ordered the cooling fan, when the amplifier came in there was no fan. It took about two weeks for the fan to catch up and a few phone calls to ACOM. When I installed the fan I noticed that the amplifier ran at least 30 degrees C cooler. I still have the filter on the fan input and I am not seeing any additional dust inside of the amplifier. I didn't find the fan making that much more noise, I still find my self checking the tube exhaust ports to make sure that there is air coming out.

I feel that the optional fan is a good thing and any time I can keep the components cooler is good as far as I am concerned. Again you have to stay on top of your filter maintenance because you are pulling more air into the cabinet. You are already on top of your maintenance so the addition of the fan should not be a problem.

Marty,

Fan is controlled...very quiet. I put a good filter on it which has avoided making my Acom vaccum cleaner too. I don't think you need it unless you run hi-power RTTY or some digital mode like OFDM which has a very high crest factor. I have a precision sound level meter 2235 bruel & kjaer and will measure sound level with it running if you really want to know.

Marty,

I have a 1999 Acom2000A with the optional fan and it seems rather quiet to me. If I recall there are a couple of shipping bolts that have to be removed that allow the fan to run quieter. I ran mine with the bolts in for years and when removed it made it a little quieter. ACOM PEOPLE IN MASS ARE GREAT..HELPED ME OUT FOR FREE

k2qmf@... wrote:

Hello All,

I had my 2000A on and running for 48 hours
in the CQWW CW contest.
Toward the end of the second day I noticed
the output power was down to about 600 watts
on 20,15, and 10 meters. Other bands seemed okay.
I had to turn the drive all the way up to 100 watts to
get about 1200 out of the 2000A. With that much drive
I was getting the "PLATE" and "DRIVE" lights lighting on
the 2000A!!! All Antennas are fine!!

Any ideas and/or suggestions???

Thanks in advance for any help...

<n6ki_73@... writes:

When my lights start coming on like that, something in the
loading gets out of kilter

I do the Manual Band Segment tune Procedure and all is well again

Put amp in "Operate"

Press "Enter" twice

Adjust power to amp so cursor goes within the bracket symbol

Amp will then give you an "OK" type message.

Try that and let me know if that works

From: Eric Scace K3NA
Topic: 1859 Message: 1864

I attempted to buy the cooling fan when I got my Acom 2000A originally. I was assured by Krassy that the fan was unnecessary, even for contest-duty RTTY operation. And, so far, Krassy has been correct. After many hours of RTTY contesting, the amp seems completely unfazed.

I've seen this on my 2000A periodically. It seems like there are two possibilities: 1) the acom is forgetting its tuning parameters, or 2) the antenna impedance has changed. As far as I know, the acom doesn't use a battery of any kind for its non-volatile memory. I think the only way it can lose tuning parameters is if it's unplugged for a long time, and even then I'm not sure that it would lose the parameters. It's conceivable that there's a bug which causes the acom to periodically lose tuning parameters, but I think we'd have heard more about that by now. I know that when it happens here it's always been #2. For example, SWR tends to change on some of my wire antennas depending on whether the leaves are out. It can also happen if a connector, switch relay, length of coax or antenna trap is starting to go bad. If I were you, I'd run some in-depth checks on these things. Sometimes the problems don't show up except at high power.

Could heat be the culprit?. . . I doubt it, but the original question was about a tribander, I believe. I can imagine a scenario in which a trapped tribander changes characteristics enough due to heating over time. When the heated parts cool, I would expect performance to return to normal. I suppose something like that could also be happening in the amp itself. It would be interesting to know if a cooling period for the antenna helps (while keeping the amp hot) or if a cooling period for the amp returns performance to normal.

This latest blurb on losing tuning parameters in the 2000A peaked my interest. I have a problem which I have not been able to solve. No problems on CW or FSK, but in SSB operation, the amp kicks out continually. Have eliminated antennas because 1) it does not occur on CW or FSK, and 2) the same behavior occurs into a dummy load. The exciter appears normal into a scope, and the problem occurs whether using the voice processor or not. Seems that the amp thinks it is being overdriven and kicks out. Don't know how to be more specific. Anyone having a similar problem?

David,

I've attached a document from Acom that lists many of the factors that will cause the amp to trip off. Hopefully it doesn't get stripped off by Yahoo.

GAIN is a result of calculating (FWD_P / DRIVE). A Low Gain protection fault results when the threshold drops below 10db gain. This doesn't tell you exactly what the root cause is but it does tell you why the amp tripped.

Jim,

I have always driven my ACOM 2000A with ICOM radios and I have never had a problem like that.

What are you trying to say? Please explain your statement.

Pat W1KA

This latest blurb on losing tuning parameters in the 2000A peaked my interest. I have a problem which I have not been able to solve. No problems on CW or FSK, but in SSB operation, the amp kicks out continually. Have eliminated antennas because 1) it does not occur on CW or FSK, and 2) the same behavior occurs into a dummy load. The exciter appears normal into a scope, and the problem occurs whether using the voice processor or not. Seems that the amp thinks it is being overdriven and kicks out. Don't know how to be more specific. Anyone having a similar problem?

As Pat states, I too have not had any issues with my 2000A running an IC 781 into it.including the famous output spike which Krassy assures me will not harm the amp. So did not go ahead with the mod to control the spike.

From: Jim Idelson
Topic: 1863 Message: 1876

Many Icoms exhibit the notorious leading edge power spike when you transmit your first dit or say your first syllable. That spike, due to known ALC issues, can easily trip the Acom overdrive sensor. It happens here all the time. The effect can be different on different modes (ssb, cw, etc). I was thinking that problem might be at work here, but he's running a Yaesu rig that doesn't have this problem.

The spike does no harm, except when the amp trips out and you don't realize you are screaming at the DX with only 50 watts instead of 1500.

1880. RE: [acom-list] additional cooling fan????

Yahoo group: acom-list (1999 — 2009)
Date: 2007-01-31 14:31:48 UTC
From: Robert Naumann
Topic: 1859 Message: 1880

When I got mine, Krassy told me the same thing. I went out and bought a fan anyway and installed it myself.

Over 3 trips to Antigua with it, and several years of using it in nearly every DX contest, SS both modes, and many RTTY contests, I have only heard the extra fan come on once. It came on, was fairly noisy, cooled the amp down, and shut off. This was during some very hot weather in TX running CW as I recall.

I actually thought the fan might not work at all since it never came on prior to that time.

My amp was installed at AA5NT's place for many years and I was not always there when it was being used. A couple of the other operators told me that they heard it run a couple of times, but not often.

Is it worth it? I don't know. Do you really need it? Probably not. Will it hurt anything by having it? Of course not.

Subject: [acom-list] additional cooling fan????

When you consider buying the Acom 2000A you are aware that there is an optional muffin fan available.

When I bought my 2000A back in 2001 I was told for SSB I do not need it.

I just wonder how many Acom 2000A users have installed the optional cooling fan and what types of temperatures do they experience?
Then, how about noise? how much more noise does the muffin fan add to the total noise the 2000A generates.

I estimate without the additional fan I see a noise level around 54DbSPL "C" weighting. I used a Radio shack 33-250 SPL meter.

From: Jim Idelson
Topic: 1881 Message: 1882

The original AcomTools program was created by Gerry W1VE. I worked with him on the requirements and features. We were primarily focused on creating a very low-profile tool that would ensure that the amp would switch to the right tuning settings BEFORE transmitting on a new frequency or band. We wanted the low profile so that the amp software would consume a minimum of screen real estate, leaving as much space as possible for logging-related windows. Hence, the small toolbar options. I would be happy to help with specification of a new set of requirements if someone wants to step up to develop the product. I would be willing to bet that the source code for the existing release can be easily obtained as a place to start.

From: edctexas
Topic: 1881 Message: 1883

The current program has a number of peculiarities. Once the program is controlling the ACOM, the RCU will not shut off the amp. The program must be terminated and the cable disconnected to stop the Acom. There are other oddities. The current program is just not very useful as it is implemented. It is a shame that Acom is not supporting it. Perhaps they will release the code and allow the user group to bring it upto date. I have not been able to get the USB serail ports that I have to operate it correctly as these ports don't really have good RTS DTR control. I guess my disappointment is due to the great way the amp works. The program is just alot short of the way the amp works.

From: k2qmf@juno.com
Topic: 1885 Message: 1885

Hello All,

My ACOM 2000A vacuum antenna relay failed
during the ARRL CW DC Contest. (Bummer).
This is the second time that this relay failed and had to be replaced.
I operate 99% CW using QSK. I am active in lots of contests...

The life expectancy of the Kilovac HC-1 relay is 2 million switches.
That seems to be a low number to me! But what do I know..

Any suggestions or thoughts would be very much appreciated.
Thanks in Advance for any info...

73,
Ted K2QMF

Sig, I agree.

Unless you're casually chatting with someone and expecting to be interrupted
(why would you need an amp then?), what's the point of stressing out all of
your equipment by running QSK? The relay in the Acom will last forever if
you run semi-break-in.

Full break-in is very distracting to me personally, but I know some people
seem to think it's necessary at all times. I don't understand that.

Sig, I agree.

Unless you're casually chatting with someone and expecting to be interrupted (why would you need an amp then?), what's the point of stressing out all of your equipment by running QSK? The relay in the Acom will last forever if you run semi-break-in.

Full break-in is very distracting to me personally, but I know some people seem to think it's necessary at all times. I don't understand that.

73,

Bob W5OV

Operate semi-breakin. It beats losing the amp at the most inopportune times.

1890. Re: [acom-list] Acom 2000A Relay

Yahoo group: acom-list (1999 — 2009)
Date: 2007-02-21 09:53:18 UTC
From: N6KI Dennis Vernacchia
Topic: 1885 Message: 1890

Bob,

I originally felt same way about QSK but after a short stint as
a SPARKS (Radio Officer) in the Merchant Marine 30 years ago,
I soon learned the efficiency and value of running QSK and actually
you were required to run QSK or be considered a LID and you
would slow down all message traffic you would be handling with
Coastal and Other ship stations!
If you ever got proficient enough to run real CW message traffic,
(and please, don't take that as a unkind remark),
you would see why running QSK saves a lot of time and makes
the handling more efficient. The party you are sending traffic to
can interrupt you in a split second to inform you they need a fill
for something missed. If QRM comes up and obliterates your sig,
you can be asked to standby, if fading is prevalent, again, having you
only send on the UP fades helps.
It also helps to know if someone is doubling with you or if someone
is QRLing
or just plain trying to steal your frequency when applied to contest
situations
I could go on and on with more reasons but you will find that many
of the
guys that win or score high in coontests or are trying to work DX
stations when
they are SPLIT, are running QSK...it also comes in handy when
you run SO2R as transmit time takes away from that second receiver you
need to hear!

Yes, it is very distracting and annoying at first but one gets used
to it and learns
to love QSK...It also helps to have a quiet QSK Transceiver and AMP with no
relay noises.....My TS-950SDX (modified to eliminat the mechanical QSK
relay
with solid state device) and ACOM 2000A combo is seamless and a
pleasure to operate in QSK mode...the only time I don't run QSK is if I
am getting backscatter which can be very annoying.

Thank You to all that responded to my request for info
on the Acom 2000A relay problem.

I have become too accustomed to QSK. I don't think I will be
able to go to semi breakin. I would seem like a step backwards
to the old days of switching the antenna with a DowKey relay.

I guess I will have to plan on changing out that relay every couple of
years...
Thanks again for the input.

Chas congrats on the "OUTSTANDING" ARRL DX CW Score... Wow.

1895. ACOM 2000A RCU problem

Yahoo group: acom-list (1999 — 2009)
Date: 2007-02-26 21:34:50 UTC
From: Norman Alexander
Topic: 1895 Message: 1895

I recently have purchased a new 2000A and been enjoying great performance for several weeks. However just a few days ago the following problems occurred. There were many variations, but I shall list a few -
Upon activating the RED on/off, count down began normally - at about 133s, the unit froze, several LEDs came on and the TONE began sounding. None of the functions would work on the RCU. Powered down using main switch. Repowered, started count down, but noticed the time was only 77s. Count completed okay, unit powered up. After a few minutes, Lights, Tone and lockup. Other restart attempts showed premature STEPPER MOTOR checks (mid countdown) and still a stable mode lasted just a few minutes. Contact with ACOM produced a quick response and some instructions. The some what stock guidance was to check power, fuses, plug wiring and other things relating to MAINS supply. Symptoms said this was not the problem, but some form of logic problem. More emails, always overnight response - Stan in Bulgaria and Willy in USA.

A procedure for checking assembly problems in the RCU was outlined which checked cable connections externally and opening (remove the bottom plate, and screws holding PC boards)the RCU for checks. There are a couple of assembly issues that could cause a fault with the PC Tracks, (LCD mounting tabs) and a possible missing insulator. None of these were an issue. However Willy suggested unplugging the EPROM (resets it) and replace. This was done, and viola all is well! Some how the EPROM got corrupted, and reseting it seems to have cured the problem.

The cause? Not known. Will it be a permanent solution? Hope so, time will tell. I thought sharing this experience may be useful to others. Again my compliments to Stan and Willy, their responses were quick and useful.

Norm W4QN
One thing that I am taking more precautions on is making sure there is proper grounding, and no RF in the shack. This problem began after operating on 80m, which sometimes can result in strong RF fields in the shack depending on the antenna configuration. (mine is a 1/4w sloper)

Hello Again all,

I replaced the Vacuum relay in my 2000A and all is working
like new again!!

I ordered a brand new relay from Gigavac. Part number is "GH1-Ham".
It is an exact replacement for the Kilovac HC-1 and Jennings RJ-1A.
The cost, brand new, is $69.00 for Hams Only!! You must provide your
call sign
to get that price.

Now at least I know I have a new relay and not one that has been pulled
from
some equipment and may already be close to its life expectancy.

http://www.gigavac.com/products/relays/ham/index.htm

Check it out!! These relays are approved by Acom for the amp.

73,
Ted K2QMF

1902. serial number mismatch

Yahoo group: acom-list (1999 — 2009)
Date: 2007-02-27 04:12:28 UTC
From: Eric Scace K3NA
Topic: 1902 Message: 1902

Does someone know how to reset the RCU for an Acom-2000A to eliminate the "serial number mismatch" soft error message?

At one time in the past I carted my amp off to the amp hospital... but neglected to bring the RCU. When the amp returned, it apparently looks for the RCU that was used in the shop. After the warm-up period, my RCU displays this mismatch error message for a few seconds... and then goes into the normal standby mode.

It's not a showstopper, but it would be nice to fix.

Right :-)))

I got the Icom yesterday and I noticed one can connect the amp in
more then one way.

The original Icom PA is connected to a data jack and ACC2, in the
manual Icom wants uou to use another connector "for non Icom linears" and ALC.

My plan is to use just pin 2 and 3 of ACC2, no ALC.

Am I correct here?

FWIW, I had to replace the relay shortly after my amp was delivered. It was a Kilovac HC-1. By great good fortune, I happened to have a brand-new Jennings RJ-1A in my junk box. I've not had a problem since, going on six years. Krassy said they had a bad batch of HC1s and sent me a replacement Russian relay and some silvered braid, but they're sitting in the junk box.

I know of others who had to replace the relay multiple times, and have had problems even with Jennings relays. I'm virtually certain that I did a bunch of QSK testing when I first got the amp, and have always suspected a QSK timing bug damaged the relay. Since replacing the relay, I almost never use the amp with QSK.

I should point out that QSK loops are a two-way street, and that different tranceivers use different timing. The problem could be a mismatch between the transceiver's concept of the QSK timing sequence and the 2000A's concept.

Easy.....great combination.

No problems with any ACOM amp.

PRO III with Acom 1000 or Acom 1010, had three Acom 1010 on the XT2C Expedition. (JAN 07)
Two weeks no problems. 24/7 on.

IC-756 PRO III and 1010.

Thank you ACOM!

I have one of the early 2000A's. Still using the original vacuum relay. I do use QSK almost all the time on CW. I never use the relay output of a rig to key the amp. I find the fastest transmit ON signal and use that to drive a power mosfet to key the amp. Presently that is what I am doing with my K2 and TS950SDX.

Subject: [acom-list] Re: Acom 2000A Relay Followup

FWIW, I had to replace the relay shortly after my amp was delivered. It was a Kilovac HC-1. By great good fortune, I happened to have a brand-new Jennings RJ-1A in my junk box. I've not had a problem since, going on six years. Krassy said they had a bad batch of HC1s and sent me a replacement Russian relay and some silvered braid, but they're sitting in the junk box.

I know of others who had to replace the relay multiple times, and have had problems even with Jennings relays. I'm virtually certain that I did a bunch of QSK testing when I first got the amp, and have always suspected a QSK timing bug damaged the relay. Since replacing the relay, I almost never use the amp with QSK.

I should point out that QSK loops are a two-way street, and that different tranceivers use different timing. The problem could be a mismatch between the transceiver's concept of the QSK timing sequence and the 2000A's concept.

While there are many that will recommend using an external buffer box
to protect the internal relay... (and many that will scream about it ...)
especially if your going to run qsk,,,, due to the duty cycle ....
it will work the way Icom intended... by grounding pin 3..

However you should read up on the external relay option :
http://www.qsl.net/icom/auxrelay.html

Probably the best way to handle the amp switching function is to use a MOSFET solid-state buffer between the Icom and amp. On the Pro-III, one can access the SEND line through one of the two ACC ports.

Although the MOSFET structure in and of itself offers excellent isolation, an opto-isolator can be used to provide further isolation from the amp. One such device is the "KeyAll," available from Jackson Harbor Press. The Keyall is designed to optically isolate the amp from the radio and will switch both positive and negative key lines up to 500 VDC/VAC @ 2.5 amps:

http://home.att.net/~jacksonharbor/keyall.htm

At just a bit more than ten dollars per kit, it doesn't really make sense to design your own. This is a much better solution than depending on the rig's external key line relay.

Paul, W9AC

I use the "other connector", the "send" jack and no ALC.

RCA jack to RCA jack. Could not be simpler.

See page 17 in the Pro III owner's manual.

Right :-)))

I got the Icom yesterday and I noticed one can connect the amp in
more then one way.

The original Icom PA is connected to a data jack and ACC2, in the
manual Icom wants uou to use another connector "for non Icom linears" and
ALC.

My plan is to use just pin 2 and 3 of ACC2, no ALC.

Am I correct here?

I always use a solid-state signal to drive my amps. Most Yaesu rigs have TX GND / TX ENA signals available on the rear panel for that purpose. They plug right in to the keying loop on the Acom.

You have to use the loop if the rig doesn't have a long enough delay between key down and the start of the RF envelope. The delay isn't adjustable on my FT-1000D, so I use the keying loop. I don't recall which rig I was using with the Acom when I first got it. It was either an FT-990 or an FT-1000MP. The MP had a delay adjustment and a keying loop. The 990 didn't have an adjustment. The 990 had a notoriously poor QSK envelope, so it wouldn't surprise me if its keying loop algorithm/timing wasn't compatible with the Acom. There's variation among manufacturers in this regard. For example, Ten-Tec has a different concept of how the timing sequence should work.

I had a TS-940, and later a TS-950SDX, that I used with an 87A. I had to do some surgery on the 940 to bring a +12VDC transmit signal out to the back panel to silently key the amp. I can't recall whether I had to do that to the 950 (I did have to tap the bandpass filter matrix to drive my band decoder...)

Anyway, the speed of the 950's transmit signal isn't the primary consideration. It's the delay between that signal and the start of the RF envelope. As I recall, the delay is adjustable in the 950 configuration menu. I think it has a max of 15ms, which should be fine for the vacuum relay in the Acom.

The relays used in the Acom have a nominal cycle time of between 6-8 ms when keyed with 24VDC. The relay can close faster if you use a circuit that briefly allows a higher voltage to appear across the coil. The QSK mod for the SB-220 sold by Rich Measures, AG6K, uses that trick (not an endorsement of his other products.) AG6K claims his circuit can cycle the relay at less than 2ms. I don't know if Acom uses any tricks like that, so to be safe I'd use a delay of no less than 10ms.

One of the things I like about my 87A versus the 2000A is the PIN diode QSK. You don't have to worry about switching speed and it's absolutely silent! You don't need a keying loop, either (the 87A keying loop doesn't work properly anyway.) Love the Acom, but the PIN diode QSK is the reason the 87A is on the main run radio in my SO2R contest station (well, that and the 87A's dynamic autotune feature.) Reliability? I've had one PIN diode faiure in 12 years (knock on wood), and I replaced it myself. The relay in the Acom failed once, so they're even.

1915. Acom 1010 amplifier for sale

Yahoo group: acom-list (1999 — 2009)
Date: 2007-03-07 15:33:05 UTC
From: Charlie, W0YG
Topic: 1915 Message: 1915

I have a Acom 1010 for sale. I don't see a mark on it. Comes with the original manual. I am the original owner. Works perfect! I want $2100.00 shipped in the lower 48.

I also have a Pelican case that I had foam inserts made expecially for the 1010 amplifier. This is a special 2# foam, more resistant to vibration than standard foam rubber. The foam has been cut so that none of the knobs or projections impinge into the foam, thus eliminating the possibility of damage when shipping or checking on an airline. The case is the Pelican 1620. I want $275.00 shipped in the lower 48 for the case. It comes with an extra latch in case one gets broken.

Mike, you need to connect the ACOM's PTT input with the 7 pin "Remote"
connector:
http://tk5ep.free.fr/tech/ts850/en/pinouts.htm

Use pins 4 (TX short) and 2 (common) where:
Remote pin 2 = common = shield of cable / RCA plug
Remote pin 4 = TX short = center of cable / RCA pin

As we enter spring we are reminded to replace the batteries in our smoke and carbon monoxide detectors. I'd like to add the following to that list:

It's time to check your Acom amp dust filter. cleaning or replacing it will ensure proper air flow.

By the way, you really need to check out the ICE [Industrial Communication Engineers] 240V 25A model 338 in line protector for delicate equipment. It's the season for power line hiccups and brown outs, and surges all that may be fatal for any sensitive device.

We all think a linear is a big brute force box, well it has microprocessors, SMD components and other goodies that do not like surges, spikes, and bad AC power!

The new amplifiers of today are no where near the wire plier yank types of the 1950's and some newer!

Good points, Marty. I do have whole-house surge protectors from ICE. I also have ICE surge protectors on the telephone lines.

A number of years ago, I took a hit that came up one of my phone lines. It knocked out the answering machine, jumped to an adjacent electrical outlet, killing a TV, then went upstairs, took out control circuitry in my heat pump and also blew a patch of wallpaper (which had a metal foil running through it as part of the design) off the wall, adjacent to the thermostat! Interestingly, my computer (connected to a telephone modem on the other line) and ham gear, which was on at the time, went unscathed.

BTW, if anyone is interested, I have an extra, brand-new ICE 340 telephone line surge protector that I'd be willing to part with. I bought it several years ago, anticipating putting in a third phone line (for the kids, but they got cell phones instead) which never happened. Contact me directly if interested.

Hi Steve,
As mentioned below, every time someone posts to the list, they get an
empty email from null@.... I don't see any way to figure out
who it's coming from, but I presume it's a configuration issue. Any ideas?
Tnx,
Barry

Sorry gang. I thought it was addressed to K1IIG, and as I clicked send,
I noticed it went to the list.

Ignore it.
Tnx,
Barry

1927. Questions from new ACOM 2000a owner

Yahoo group: acom-list (1999 — 2009)
Date: 2007-03-22 14:05:30 UTC
From: billdz.geo
Topic: 1927 Message: 1927

Hello all. I just bought a used ACOM 2000a and was very glad to find this group. The ACOM sure looks like a solid, quiet, easy to use amp.

There are a couple of things I couldn't figure out from reading the manual, perhaps someone could give me guidance.

First, and most serious, is that I do not seem to be able to apply more than 10 watts of continuous carrier without getting a fault. I can get the amp to auto-tune by applying 10 watts of drive. I can then turn my transceiver (Kenwood TS-480SAT) to SSB, increase drive to 50-60 watts, and get a full 1.5kw or more of output with no problem. But if I change to CW and hold the key down for a few seconds, I get a fault, even with drive as low as 15 watts. This happens even on auto-tune, where the display says to apply 10-20 watts of drive. If I apply 10 watts, it auto-tunes fine. If I apply 15 or 20 watts, it faults.

When it faults, the message on the display is either Detected RF Power at Wrong Time, or Automatic Protection Drive Power Removed.

According to p.26 of the manual, the Automatic Protection message is only supposed to appear 10 seconds after the message Remove and Reduce Drive Power appears. However, I have never seen the Remove and Reduce message, and the Automatic Protection fault occurs in less than 10 seconds.

Any thoughts on what is going on? Thanks in advance for any help.

73,
Bill NZ5N

just a guess... did you try on a dummy load ???

i had antenna feedline problems, that had not been detected till I
put the 2000a on that antenna...
but that was a different fault "arc"...

and if you are in auto tune, i could see where it would not allow
much power while in autotune mode...ever...

i am certain some smarter more experienced acom users will save you ...

you could call krassy or will at acom ... they will help you...

congrats on the new box, you lucky guy,....

bill

Thanks for the reply. Unfortunately, I don't have a high-power dummy load, maybe I'll have to borrow one.

But if the problem is in the antenna, why does the amp allow me to transmit a full 1.5kw on SSB? It only faults when a continuous carrier is applied.

Does the auto-tune just adjust the amp's tuning and loading for maximum output, or is it also supposed to adjust the automatic antenna tuner? If the latter, I'm not sure that the antenna tuner is working. My 40 meter antenna has a normal SWR of 1.5:1. I performed the auto-tune on the amp, but the SWR is still 1.5:1, according to the RCU display. I would have thought that the tuner would reduce it to closer to 1:1. Or is there something else, apart from auto-tune, that needs to be done to make the antenna tuner work?

1930. Re: Questions from new ACOM 2000a owner - problem solved!

Yahoo group: acom-list (1999 — 2009)
Date: 2007-03-22 18:53:21 UTC
From: billdz.geo
Topic: 1927 Message: 1930

I spoke with Will and everything is now working 100%. With respect to the faulting, the problem was in the connection between my transceiver and the KEY IN plug on the amp. As for the SWR, Will explained that, contrary to my prior understanding, the amp does not have a true internal antenna tuner. It's just that the L-netork enables the amp to work properly with an SWR up to 3:1. However, the SWR does not change.

I look forward to contributing to this group and to using the 2000a in the contest this weekend.

there is NOT an antenna tuner within the 2000a...
do you have an external tuner between the amp and the antennas ?

The output section of the 2000a DOES tune the output section to
"match" the load , which doe not have to be be a perfect 50Ohms..
which could be interpreted as matching the amp somewhat to the antenna.

Which in fact is what an ant tuner does,,,, it doesn't change the
antenna, but 'tries' to match the antenna to the amp or transceiver.
It could be viewed that the tuner & the antenna are then "tuned".

If you looks at the RCU that is why the swr indication doesn't
change..... but the amp is 'trying' to best match the load....but the
ant stays at whatever it is...

IF the antenna presents a 1.5 to 1 swr.... I don't have guess why
the amp is having that problem.

DOES IT WORK OK WITH LESS DRIVE on cw SAY 15 WATTS...??
and then fault at a particular power out ??
bill

1933. Good idea to buy spare tubes?

Yahoo group: acom-list (1999 — 2009)
Date: 2007-03-25 23:28:38 UTC
From: billdz.geo
Topic: 1933 Message: 1933

I was wondering if it would be a good idea to pick up a couple of spare finals for my 2000a. Guess it's always nice to have extras if needed in an emergency, and the ebay price is still relatively low, about $250 for a matched pair, although the going price has gone up substantially in the past couple of years.

However, a few things give me pause:
* gettering - I know it is necessary, how difficult is this to do?
* testing - Is there a way to test the spares without removing the existing finals from my amp?
* reliability - The inexpensive tubes are from Russian suppliers, and there have been reports of people getting bad tubes. The lowest price I have seen from a U.S. supplier (RF Parts) is $350 for one tube.

Any thoughts?
73,
Bill NZ5N

Bill,

I think you should put the money in a CD or other investment instead.

I bought a spare set of tubes for mine thinking it would be likely that I would need them, but the Acom is so well engineered that the tubes are protected completely from damage.

I'm still on my original set and my 2000A is one of the early ones.

Bob,

My experience with the ACOM2000A tubes was just the opposite. The new unit went back to ACOM three times. In each case it was tube failure. It was a low serial number unit. Perhaps the tube QC issue was solved in later units.

I suspect that Russian tubes were used. The replacement Russian tubes one can find might be no better.

Brian,

I'm sorry to hear you had that trouble, but I think yours was a unique experience. Did the tubes just fail due to defect or were they damaged in operation? Was an "autopsy" done?

My tubes are all Svetlana - including the spare set I bought from "Tom's Tubes" years ago. Who else makes 4CX800A's?

I have had my 2000A for 7 or 8 years now with some fairly rough treatment (a few trips to Antigua as airline baggage) and use at numerous unsupervised (me not there) multi-ops here in the states in every major contest over the entire time I have owned it.

Since the tubes are fairly cheap, it's no harm to have a set, but I think the vast majority of 2000A owners have not had any tube troubles.

73,

Bob W5OV

1938. RE: [acom-list] Good idea to buy spare tubes?

Yahoo group: acom-list (1999 — 2009)
Date: 2007-03-26 13:16:04 UTC
From: Jim Idelson
Topic: 1933 Message: 1938

In the old days, with traditional amplifier designs, we worried about keeping spare tubes because they did fail over time and they could become difficult to procure in a pinch. But, with this amp, things are different. Those tubes are well-protected and not hard to find. I think more about other FRUs (field replaceable units) that might fail and become difficult or impossible to acquire. Do you have a spare programmed digital control board? Stepper motor? Those are the kinds of things that worry me. I sure hope Acom is around for a long, long time.

A couple of people have mentioned Tom's Tubes. I was sad to hear that Tom passsed away in 12/06. It appears that no one has carried on his business.

From: k1iig
Topic: 1933 Message: 1940

ALL,
I just had my tubes replaced as a result of the "low bias on startup" fault.
Acom first replaced a 47uf in the bias supply which has been a known cause of this fault which did not fix the fault. After that they changed the tubes and everything was ok at that point. Even though it was bought in 1999 I had very few hours on the tubes. Putting new tubes in requires you to follow an alignment procedure to balance them. Acom uses the Russian tubes. Acom in Medway MA is very helpful and I too hope they stick around for a long time.

Bob,

My 2000A is about 4 years old, and I had a tube failure in the first year of operation, with relatively low hours on the amp, and very light duty use. The amp started to fault out and not come on, so I called Krassy who said he thought it sounded like a bad tube. He ended up dropping in for a visit over a weekend and brought along several tubes to find a nice match, which he did. After installing the tubes, he set up all the voltage parameters for the amp by adjusting several pots and I was up and running.

So remember, one might not wish to just plug and play a new tube. There is some set up to be done too.

And besides that, they are ALL Russian tubes. A GU74 (the Russian Type Number) goes for less than $100 in Europe. And the Russians used Gadzillions of them in their military equipment so I don't think they'll ever be rare.

The recent posts about tubes broght this question to mind.
In the following common scenario I wonder which of the choices some of you choose.'You turn on your Acom 2000 and work a station then don't plan on using it for several hours'. Do you turn your amp off or do you allow it to idle? Which situation will preseve tube life better?

I believe tube life will be longer if you avoid as many startups from
a cold filament as possible. Tubes rarely fail while they are
running, but mostly during the cold startup.

That said, I do not keep mine running 24/7, but do shut down whenever
I close the station down. I know others that leave them on
continuously.

This question came up a few years ago and Krassy said it's better to
turn the amp off when not in use. I believe there is gradual voltage
buildup for the filaments.

The 2000a manual says to shut off if you will not be using the amp for over 30 minutes. It even says to shut off the on/off switch on the amp itself, not just shut off with the RCU (when you shute off with RCU, the red light on the amp stays on). Anyone know why it is necessary to flip off the switch on the amp? Is there something that stays on (other than the red light) when you only shut off with the RCU?

Just to summarize the the responses to whether to let the Acom idle or switch off, the majority say they leave the amp on for hours, often for days. But as Barry pointed out Krassy's statement is to shut it down. I think the best advice is to follow the manufacturer's recommendation. I might just add I have done both over almost eight years (one of the first half dozen sold in the states) and my output has not changed. Seems like a pretty darn good design.

When I leave my station, I turn off and up-plug unit.

Last several years....

GREAT AMP.....2000A! 1000 and 1010.

Purchased the Acom 1010 for last expedition, on for two weeks, no problem
with any of the amps (4) with XT2C dxpedition.

With all the digital circuitry in these amps, I think Bill's approach is a good one. Lightning and power surges are insidious. Completely disconnecting radio gear is a really good way to go.

1951. Re:opinions wanted

Yahoo group: acom-list (1999 — 2009)
Date: 2007-04-01 17:27:22 UTC
From: Hal Kennedy
Topic: 1943 Message: 1951

For contesting, both 2000A amps go on (SO2R here) an hour before the start of the contest and each amp is "auto-tuned" for each antenna. They then both stay on all 48 hours, even if I take a six hour nap along the way ;-).

For general DXing, the 'everyday' amp gets turned on when I hear something I need/want, and gets turned off only when I am convinced I will not be back near the radio for many hours. Typical on time is 4 hours a day.

One of my amps I bought from K4JA. It had been run hard, but under the same contest conditions as above - on for 48 at a time then off for weeks at a time. When Paul owned it, the tubes had to be replaced at 1500 hours. I then bought it and babied it by comparison and failed a set of tubes at about 2000 hours. I spoke to Tom at Tom's Tubes before he went SK and he said 3000-4000 hours was typical. These Svets do not have the life of the typical Eimac, but at 1/4 the price I am fully satisfied. My second amp has 3000 hours on it and the original tubes are still FB. It only gets run in 48 hour increments.

I just lost the blower bearings in the high-hours amp - it appears easy to replace.

Hello All,

My 2000A has developed a problem and is not useable.

When I turn on the amp I get "MICROPROCESSOR CONFLICT"
and the "PROT" light comes on and the amp shuts off.

I notice that when I turn the amp on I do not hear the fan come on
as before!!

Any help or suggestion would be very much appreciated.

The first thing I would check is the socketed chip inside the control
head for poor connection.

I'm not sure if that will resolve it, but it cannot hurt, and it is not
a major surgery.

Ted,
The suggestion to open the remote control unit and reseat the Chip is a good idea. My 2000A began to have some squirrely readings and the amp did not function. Contacting ACOM in (MA) resulted in the suggestion to remove and replace the chip.

Contact "willy" he may have a procedure outline that will take you through the steps. If I saved mine I will send it to you.

Ted,

I had a problem years ago with the controller and found that the cable connector inside the controller had loosened up. I reseated it and all was well. PLEASE BE CAREFUL TO NOT FLIP THE CONNECTOR, IT IS NOT KEYED AND WILL GO IN EITHER WAY. Will is very helpful on all the problems.

Hello Bob, et al,

I am still troubleshooting the "MICROPROCESSOR CONFLICT" problem.

I tried reseating the EPROM and checked all connectors and wires. All is okay
but the problem still exists!!
I have been in touch with Stan at Acom via E-mail and he has suggested some
voltage and resistance checks which I am doing now.
The problem looks like it is on the Microprocessor board inside the 2000A!
Will called me and suggested sending him the amp and RCU.
I will keep the group informed as to my progress!

It had to happen now that N8S is up and running!!

Happy Easter to All,
73,
Ted K2QMF

EUREKA !!!!

With the help of Stan at Acom I have located and corrected the
Microprocessor Conflict problem!

It was a bad Ceramic Capacitor on the "Central Processor Unit" board
inside
the amp itself. It was C6 which is a 22nF / 50V Cap.
A big job to replace but if one takes their time it can be done. :-)

Now on to N8S...

73 and Happy Easter / Happy Passover to all....

Congrats Ted!

I worked N8S with my 2000A easily on 20 CW Wednesday morning. Good operators
on this DXpedition.

73,

Bob W5OV

P.S. I am selling my Acom 1000 - please email me direct if anyone is
interested.

EUREKA !!!!

With the help of Stan at Acom I have located and corrected the
Microprocessor Conflict problem!

It was a bad Ceramic Capacitor on the "Central Processor Unit" board
inside
the amp itself. It was C6 which is a 22nF / 50V Cap.
A big job to replace but if one takes their time it can be done. :-)

Now on to N8S...

73 and Happy Easter / Happy Passover to all....

1960. Turning off the ACOM 2000a

Yahoo group: acom-list (1999 — 2009)
Date: 2007-04-08 03:15:37 UTC
From: billdz.geo
Topic: 1960 Message: 1960

Asked this a week or so and did not get an answer: When you turn off the amp with the RCU, the red light on the amp continues to shine. Tha manual recommends turning off this light with the amp's off/on switch if the amp will not be used for 30 minutes or more.

Just wondering what is still "on" when the amp is turned off with the RCU and the light is still on. Is only the light on, or is there an active circuit?

73,
Bill NZ5N

It's like a TV set , even when it's off , it; s on,.,,,

at least the control circuitry,,,as it's still driving the
remote and listening for commands from the remote.

Yes - certain portions of the low voltage power supply that runs the CPU is "on". The HV is off.

1964. FW: [acom-list] optional Fan installation instruction ACOM 2000A

Yahoo group: acom-list (1999 — 2009)
Date: 2007-04-08 16:30:27 UTC
From: Maximo EA1DDO/HK1DX
Topic: 1964 Message: 1964

Hi Yann,I did it some time ago. I don´t have any special instructions. You need to buy a standard size fan to 24 VDC (yes, 24 VDC, don´t 12). You need 4 screw around to fix the fan to the amp enclosure. After remove the amp cover, you have to remove the filter on the back of the amp then you get a clean hole just to fix the new fan in the outher side of the enclosure (outside, don´t inside). There is a small piece of PCB to solder the fan cables. You can attach the filter to the other side of the new fan. Before install the fan be shure the correct polarity to move the air from OUTSIDE to INSIDE. The new fan works automatically when the inside temperature goes above 80 degrees (aproximatelly).73, Maximo - EA1DDO.PD. Try to get a good quality fan, I mean, aluminium frame and ball bearing.To: acom-list@yahoogroups.comFrom: f5nbu@...: Sun, 8 Apr 2007 12:48:21 +0000Subject: [acom-list] optional Fan installation instruction ACOM 2000A

Bill,
At a minimum the low voltage power supply has to be on to provide power to the RCU, so it will function and also to power the unit red light, etc.

This is a common approach to many products (TV the most notable) including my IC 7800 has a main on-off switch on the rear panel, not very convenient in some installations I am sure. But always shut that down when not in the shack. Just one more step of isolation from power surges that can be frequent here in Florida.

Regards,
Norm

1972. Low receive strength

Yahoo group: acom-list (1999 — 2009)
Date: 2007-04-12 00:25:15 UTC
From: Neal Campbell
Topic: 1972 Message: 1972

Hi all

Today I turned on my 2000A after a few months of idleness. After the warm-up period, when I went from standby to operational, the reception signal strength just disappeared. S9 signals no longer there at all.

The amp itself seems to output at full power (at least according to the remote.

Any ideas? The problem persists after a power recycle.

1973. AC voltage too high and ACOM won't work

Yahoo group: acom-list (1999 — 2009)
Date: 2007-04-12 20:18:37 UTC
From: billdz.geo
Topic: 1973 Message: 1973

I'm having a strange problem today bit it's not the ACOM's fault. After warm up, the yellow Heater light was flashing, and the amp would not turn on. Investigation revealed that the Mains voltage was 264v and the filament voltage at 14.0v. As suggested by the manual, I went into the Off Menu and reset Mains Voltage to High, but the problem persisted.

I called Will at ACOM, who advised that the Mains Voltage control is not capable of dealing with a voltage that high, it should be about 240v, not 264v. He suggested I call the power company, which I did, and they said they would send someone over, but it could take up to 24 hours. In the meantime, I'm off the air, probably not a good idea to be running any appliances with the voltage so high.

Wonder if anyone has ever had a similar problem. I've lost power plenty of times, but this is the first time I've ever had too much power.

73,

Happened to me a number of years ago. Had the power company's "voltage investigator" here and he hooked up a recording voltmeter for 24 h to my mains box. Confirmed the overvoltage, made some calls, and things were fixed within a few days. He also told me if any electrical appliance blew recently or blow within a month or so, file a claim and they would pay it.

Thanks for the replies, it dropped to 249v before the power company even got here and the amp is working again, don't know what happened. The power guy came by later, he also read 249v, and said the higher voltage might have been a bad regulator at the substation. Just as Barry said, the guy told me they would pay if the extra voltage damaged anything. And as Howard said, would not have even known there was a problem but for the ACOM.

Filament voltage when it was 265v was 14.0v. Now it is 13.1v. Is that close enough to the normal 12.6v?

1978. Re: AC voltage too high and ACOM won't work

Yahoo group: acom-list (1999 — 2009)
Date: 2007-04-13 16:12:29 UTC
From: Hal Kennedy
Topic: 1973 Message: 1978

I also had this happen last summer. The amps would run, but they were both blinking their "filament voltage too high" message. If I recall the line voltage was around 260VAC. I called the power company and they very politely told me their "requirement" per my customer agreement was 240VAC +/- 10 %, so I could see up to 264VAC without their having to do anything. Oddly, this happened on one of the hottest days of the year with everyone running their air conditioners - but the power company said that's when they usually crank it up to "meet the demand and avoid brownouts."

Within a day it was back to its usual 248VAC here and it has not happened since. 264VAC is too high for most equipment, not just the ACOMs!

I remember rebuilding a Kenwood TL 922, one of the problems in this amp is
overvoltage on the filaments of both 3-500Z Eimacs.

It should be 5,0 Volt and it actually was 5,8 causing tube life MTBF
to 30% max of normal.

So running those filaments on high voltage is a major problem, one
should avoid this.

1980. an good idea ?

Yahoo group: acom-list (1999 — 2009)
Date: 2007-04-14 09:09:32 UTC
From: Hans , PA3HGT
Topic: 1980 Message: 1980

I sent this email to Acom :

Hello,

I owned a Acom 1000 and a Acom 2000.
I sold the Acom 2000 because i have no possebilities for 3 year to do
the HAM-hobby.
The Acom 2000 is very good amplifier but i miss the feeling of
tuningknobs like the 1000.
I like to tune the amp for myself and not automatic.
The power of the Acom 1000 is bit to little for me and the power of
the 2000 is enough for me but the prizedifference is very big.
Is it not a good idea to develop a model between the 2000 and the 1000
with manual tuning with 2 times GU74B ?
You will get almost the power of a 2000 like OMpower en Alpha does
with their OM power 2500 and the Aplha 8100.
And you will fill up the prizegap between the 1000 and the 2000.
And Alpha and OMpower has a competitor in their class,specially OMpower.

Met vriendelijke groet,

Hans Pluijgers
PA3HGT

www.pa3hgt.nl

What's is your opinion ?

Sorry for me English , it's not that good,HI.

On my 2000A, the extra fan only turns on when the amplifier gets too hot.
Then the fan cools the amplifier down very quickly and then the fan shuts
off.

My optional fan runs all the time,(2000A about 1 1/2 years old) not very fast but it is turning steady and the amplifier never gets hot at all. I have never seen my temperature go more than half scale no matter how I am running the amplifier.

yes, mine also... very slow until needed, which is rare. But I recommend it for multi-carrier/OFDM modes as found in Digital voice where the crest factor can sneek up on you and warm the tubes up very quickly.. I installed a very good filter to minimize contamination which I know ACOM is quite concerned about for those who add this fan.

Fan works fine, probably last a long time and won't rust. :-)

From: Jerry
Topic: 1989 Message: 1989

With all of this discussion about the optional fan for the 2000A recently I'm wondering about the specs for the fan. I understand that a 119mm x 119mm, 24VDC fan is required. These kinds of fans are readily available from different manufacturers. Assuming the amp owner would like to obtain one on their own would any of the owner's of the Acom supplied fan care to share any of the specs that may be inscribed on the fan? Who manufactured the fan, manufacturers part number, what is its thickness, speed, CFM output, back pressure rating, etc.?

1990. ARC Fault

Yahoo group: acom-list (1999 — 2009)
Date: 2007-05-01 16:40:41 UTC
From: Kelly Johnson
Topic: 1310 Message: 1990

What does "ARC Fault" mean? In my case, it appears to either mean a SHORT in my coax or an OPEN. Which is it? I suspect, the problem is a bad PL-259 solder connection but would like to narrow the problem down further before climbing the tower.

It sounds like an OPEN, because signals are dying just before and/or after the ARC fault suggesting a bad connection sonewhere. Sound right?

Kelly,

If you had a short, it would fail constantly. An arc is just what it says - a breakdown of insulation somewhere.

You should not assume that it is up the tower. It can be anywhere - starting right at the output of your amplifier.

Swap out things to isolate the arc.

Does the arc fault occur on SSB or only on CW and
other continuous carrier modes? If the latter, the
problem may be a "hot start" caused by the generation
of RF from the transceiver before the relay closes.
The relay needs to be closed before RF is applied.

Although both Bill and Bob are right, I recently did some work on my amp (cleaning :-)) I forgot to reattach a delay I use associated with the Heil foot pedal and developed the arc fault on CW. Start at the amp and check all connections as suggested. If possible put a dummy load right after the amp to eliminate faults up the line.

Also note that the ARC fault is intermittent. In fact, it was absent long enough yesterday for me to use the amp to work BS7H, but I got a couple of ARC faults just before that.

The reason I am assuming it is up the tower is that it only happens on 40 meters and I have a single coax running up the tower for all bands to a remote switch where separate feeds split off. Also, I've had problems for months now with my 40m yagi "dropping out" intermittently. Signals will be S8 or S9 and all of a sudden they drop down to S0 until I key the rig and they come right back. I thought I had fixed it by replacing the coax connector on the 40m feed right at the remote switch. It seemed to work for awhile, but now the problem is back. It's far more difficult to replace the other coax connector (at the driven element of the 40m yagi) because the feedpoint is 8 feet out the boom. I need a boom truck or something to get up there. That's why I'm looking for possible causes before renting the boom truck. I don't believe I've seen an ARC fault while running on any band except 40m.

Kelly,
Looks like you have narrowed it down pretty well. sometimes if the antenna is a bit off, the voltage increases at a given point which leads to arcing. The amp does a great job of protecting itself and other equipment or antenna parts.

1998. Re: [acom-list] Low receive strength

Yahoo group: acom-list (1999 — 2009)
Date: 2007-05-02 18:05:01 UTC
From: Neal Campbell K3NC
Topic: 1972 Message: 1998

For completeness of the mail archives (and in case there is possibly someone dumber than I, which is a small probability), here is the solution.

I called Acom about this and Will suggested to send the amp back for him to debug. After 2 days from arrival, he wrote that all was tested and working correctly, so something was wrong at my shack. He suggested that the keying line might be shorted. Sure enough I had accidently shorted out the plug by placing it on an aluminum case, hence when I switched the amp to Operational, it thought it was xmitting even though my rig wasn't.

Sometimes (always?) I reach for the "worst" conclusion for problems when a simple one is staring me in the face. But, at least the amp wasn't damaged!

1999. RE: [acom-list] ARC Fault

Yahoo group: acom-list (1999 — 2009)
Date: 2007-05-03 03:08:46 UTC
From: Robert Naumann
Topic: 1310 Message: 1999

What you say makes sense.

Try swapping antennas on the remote switch - in other words, move the 40m coax to a different position. This will confirm where the problem is.

73,

Bob W5OV
(still need BS7H but heard them 579 working EU all day today on 20m CW)

Subject: Re: [acom-list] ARC Fault

The reason I am assuming it is up the tower is that it only happens on 40 meters and I have a single coax running up the tower for all bands to a remote switch where separate feeds split off. Also, I've had problems for months now with my 40m yagi "dropping out" intermittently. Signals will be S8 or S9 and all of a sudden they drop down to S0 until I key the rig and they come right back. I thought I had fixed it by replacing the coax connector on the 40m feed right at the remote switch. It seemed to work for awhile, but now the problem is back. It's far more difficult to replace the other coax connector (at the driven element of the 40m yagi) because the feedpoint is 8 feet out the boom. I need a boom truck or something to get up there. That's why I'm looking for possible causes before renting the boom truck. I don't believe I've seen an ARC fault while running on any band except 40m.

From: Peter Naumburg
Topic: 2000 Message: 2000

So my 2000A would not go to receive. I called Will and described the problem. He suggested that a relay may need to be replaced and replacing this particular relay is like heart surgery and my amp needs a visit to MA. So I finally go off my butt and sent my baby to the hospital. Will tested it right a way and could not duplicate the problem.

I started hooking up my back up amp and it did not work either. I had changed out my receivers and in the process switched my rec antenna cable and amp keyer cable. Ah dyslexia.

Will says that the vast majority of amps he gets back are fine. They were just installed incorrectly.

They make a great product and take good care of us!

Keep Smiling.

Peter

Kelly,

How did you replace the connector on your 40m feedline? On the tower? How did you solder it?

What kind of coax are you using? What kind of balun is it?

-Bob

2002. Re: ARC Fault

Yahoo group: acom-list (1999 — 2009)
Date: 2007-05-05 03:14:43 UTC
From: npalex@bellsouth.net
Topic: 1310 Message: 2002

I find it hard to believe that any arc fault detection would be the result of the antenna and/or feed line, but it could be, but not likely in my view - read on.

The first thing I would do is find out what ARC fault means. Is it a instantaneous Flash or breakdown between the internal parts of the tubes, grid to screen, grid to cathode? or some external circuit? If external what are likely candidates? The tank circuit where RF voltages could rise to a level to Flash over (ARC) on the variable capacitor plates. All of these types of faults will cause a significant change in current in the tube circuit. But the ARC itself is not likely detected, the result of it is however,

That means some where in the amps circuit there has to be a sensor. Given that there are likely only two possible basic measurements that can be made, voltage and/or Current the detector has to be doing one or the other.

Given that a sudden change in the termination on the amplifier (antenna connection) could cause the plate current or grid current to spike, does that surge trigger the ARC fault detector? or is it just a over current reading that trips the protection circuit? Again the question is what types of failures would trigger the ARC fault sensor?.

Considering the termination (antenna and coax) being the cause, what is likely to be happening? If this occurs under power, then the fault that is likely to occur is breakdown in the coax (short circuit) or breakdown in the termination (connector shorting). It is unlikely that under power that the failure would be "circuit opens", so the only logical failure is a short, and depending on the electrical length of cable it could look like a very LOW impedance, or open circuit if an odd quarter wave (accounting for the VF of the cable). the latter is the same as disconnecting the cable from the amp. would an "open" antenna trigger the ARC fault detector? If so then maybe the cable and 40m antenna are the culprit, but adding a few feet of cable would change that termination from an OPEN to a low value. This could be check right in the back of the Amplifier. What power level do you have to reach to trigger this ARC fault? Just a few watts, or nearly full power?

You have to find out what kind of EXTERNAL fault would trigger the ARC fault detector. There are only a few possibilities - the antenna/cable goes open (HIGH), or goes LOW (short).

But there is one other possibility - how about RF getting into the TCU and triggering a ARC fault? Low band antennas are notorius for getting RF into the shack and causing all kinds of problems. Try "grounding" the TCU case to the amp case, or to a ground buss.

Do you have a Field strengh meter, if so set that up near the TCU and see if there is a significant presence of RF when on 40m.

In moderate winds (~20-25mph) the "floppy-elemented" Force 12 I have causes these arc faults. My experience has found the C4XL can not be used in winds at these speeds because a couple or more of the elements are so close together that the wind changes 20m SWR drastically and the 2000 doesn't like that. Not related to arc faults, but the C4XL is prone to severe rain static (isolated elements) which, at times makes (at least the one I have) unusable too. Otherwise, antenna is good one. :-)

I found this to be true as well when I owned my 2000A. However, it would be nice to give the operator the ability to either temporarily disable ARC protection (and perhaps automatically re-engage at power up) or allow the operator to temporarily change the ARC point threshold.

There are times when the antenna condition is not severe enough to warrant a full amp disabling. Or, reduced power may be enough to work that rare DX station or get you through a contest weekend until the root cause can be determined.

OTOH, as a manufacturer who warrants their product for four years, I could see their resistance to incorporate this as a result of operator abuse. It does bring to mind the folks whose auto engine light come on and waits until the car's engine is broken before they finally do something about it!

For a start, why doesn't ACOM at least tell you in their manual what each fault means and what types of things can cause it?

the arc fault certainly detected a problem in one of my feedlines....

As one the guys said" trust the amp" it knows.

He was right. And the dummy load helped find the bad portion of the run.

The Acom 2000A requires routine service...you need to clean the dust filter on a regular basis.
So, this is to remind all of you to pull the filter and wash it.

I live in Arizona and it is very dusty here. I clean my filter every 6-8 weeks. By doing this the filter does not get clogged, the amp keeps its cool and is happy.

Hi,

I have an Orion driving an Acom 2000A amplifier.

The only way I found it to work properly is to connect the TXOUT and TXEN lines and use QSK with Delay=0. This is of course a problem because I drive also TX/RX relays to switch RX preamplifiers and filters.

Anyone has found a better solution for the PTT control of the ACOM with a reasonable delay ?

Thanks and regards

Tiziano

They did have a chip upgrade for the 2000A which made them less sensitive to tripping the amp this was back 3 years ago My 781 was always knocking the amp off line ,by using the new chip from acom it solved the problem with my 781.

My is using an Orion and I only used the relay tx out any problem I try look my serial # on my amp

Subject: [acom-list] ACOM 2000A with TEN TEC ORION

Hi,

I have an Orion driving an Acom 2000A amplifier.

The only way I found it to work properly is to connect the TXOUT and TXEN lines and use QSK with Delay=0. This is of course a problem because I drive also TX/RX relays to switch RX preamplifiers and filters.

Anyone has found a better solution for the PTT control of the ACOM with a reasonable delay ?

Thanks and regards

Tiziano HB9BLQ

2019. R: [acom-list] ACOM 2000A with TEN TEC ORION

Yahoo group: acom-list (1999 — 2009)
Date: 2007-05-27 19:11:53 UTC
From: Tiziano Christen
Topic: 2015 Message: 2019

Hi Carsten,

I can only drive it using the QSK control NUT only with QSK delay=0. Higher delay causes Arc Fault on the Acom. This is creating a steady switching between dots in CW. I would like at least to be able to set the QSK delay to few % in order to create a small delay between TX and RX.

Any idea what is the reason or if this is normal?

Thanks for your suggestion

2020. Connecting the ACOM 2000a To A Computer

Yahoo group: acom-list (1999 — 2009)
Date: 2007-05-29 20:45:09 UTC
From: ki4ge
Topic: 2020 Message: 2020

I just received my ACOM 2000A and need to connect it to my computer so
I can control the system over the internet.

The manual has a caution about not using a "standard" cable for the
connection between the amplifier and the computer. What type of cable
is needed and where can I get it?

I have tried to call ACOM for the last few days but get no answer.
Maybe they are still on vacation after Dayton.

Any help will be appreciated.

Jerry, KI4GE

2021. Relay failure

Yahoo group: acom-list (1999 — 2009)

From: Dave Hawes
Topic: 2021 Message: 2021

I recently had a failure of the HC1 output relay on my 2000A.

I am looking for a source of NEW (could be NEW surplus) Jennings RJ1A
or Kilovac HC1 relays.

Can anyone provide a lead? A recent satisfactory transaction would
be better info than just "Look on eBay."

Thanks.

Dave,

My 2000A is of very recent manufacture. The output relay in mine is made by GIGAVAC. The specific model number is hard to read but I'd say it is their GH1 HAM. See this link, http://www.gigavac.com/products/relays/ham/

BTW, in comparing the Jennings with the Kilovac I've had better luck with the Jennings in applications other than the Acom. But if Acom is now using the GIGAVAC I'd be inclined to follow their lead unless you get some differing opinions.

I looked further at the Max-Gain site, and they have replacement contact sets as follows:

Jennings RJ1A Price: $22.50 each
Kilovac HC-1 Price: $22.50 each

This might be the most economical solution.

73,

Bob W5OV

P.S. They're at the Atlanta hamfest this weekend and not in the office.

Jerry,

Thanks for the info. This is good to know.

Kilovac has apparently morphed into Gigavac, and the GH1 is the replacement for the HC1.

The HC1 and RJ1A have long been considered as replacements for each other, in that they have identical form factors, relay coils, and very similar performance ratings. But, like you, I have found the RJ1As to last longer than HC1s, especially in QSK service.

Incidentally, I have replaced several HC1s in 2000As with RJ1As, and they have been performing flawlessly for a long time, after failure of the supplied HC1. This is why I'm looking for an RJ1A to replace my failed HC1.

Any other info from the group?

Dave

Hi Dave,

I assume that since you are looking elsewhere, the amp is off
warranty. It might be a good idea to email Will or Krassy locally
here in NA or even Stan in Bulgaria to find out if it matters what
you use. I know a relay is a relay, and as long as it meets the
specs of the original, they there should be no reason not to use
whatever you can find.

As an aside, but mentioned in your original post, I wouldn't by
a sheet metal screw on eBay! Had a few "good" experiences there, but
gave it up 5 years ago simply because you are typically buying an
unknown item from an anonymous seller. Sure, you can give them
negative feedback, but at the end of the day, they have your money
and you have whatever they decide to send. Lots of people like eBay,
but it isn't for me.

Good luck with whatever you get. I can't find enough good
things to say about ACOM. Fantastic amplifiers.

2032. Re: Relay failure

Yahoo group: acom-list (1999 — 2009)
Date: 2007-06-02 16:14:43 UTC
From: Dick Green
Topic: 2021 Message: 2032

> I have found the
> RJ1As to last longer than HC1s, especially in QSK service.

The HC1 in my 2000A failed shorting after I bought the amp in 1991. Krassy said ACOM got a bad batch of HC1s. I replaced it with a new RJ1A left over from upgrading an SB-220 to QSK. The RJ1A has performed almost flawlessly for 6 1/2 years.

However, the ACOM is on the second radio in my SO2R contest station, and I primarily use that radio for S&P and casual DXing outside of contests (i.e., the amp gets very light duty.) Also, I don't run QSK on that radio (an FT-1000D, which clips the CW waveform in QSK.)

In last week's WPX CW contest, my run radio had problems and I ended up using the 1000D running. I got a couple of sequencing faults and two "relay is in the wrong position" faults. I believe the problem was caused by a SteppIR Tuning Relay interrupting the amp key line while RF was present. That, in turn, was caused by some faulty software of mine (don't ask, it's a long story.)

It would be interesting to know if the ACOM has a timing issue with the key line being interrupted when RF is present. I believe in that case it should cut off the tubes, route the input drive to the internal dummy load, unkey the vacuum relay, switch the input coax to the output, then fault. But I don't know if that's what's happening. Hopefully, it's not allowing the vacuum relay to switch while the tubes are running. Might be worth a query to the factory.

After getting a couple of these faulte, I changed the SteppIR Tuning Relay wiring to interrupt the 1000D's TX ENA line, and that solved the problem. Other than that, the RJ1A put in a lot of duty over the weekend without failing. Of course, I didn't use QSK, and frankly I wouldn't do that with any vacuum-relay amp. I use my trusty Alpha 87A with PIN diode switching for that!

BTW, when my HC1 failed, Krassy sent me a Russian-made relay. It's still on the shelf.

Some people have had all three relay types fail: HC1, RJ1A, and Russian. I believe they were all QSK users. It's possible the timing of their rig's keying loop was the cuprit. I've long suspected that the ACOM microcode doesn't deal with all of the possible sequencing errors.

Price with Dayton discount is $6,500.00. Been seeing used 2000As going for $4,500-$5,500 depending on age, remaining warranty, and condition. I am waiting for immediate availability of an in-stock 2000A and I'll place my order.

On a somewhat related matter, I am seeing a distressing trend today among other vendors of high-end transceivers and amplifiers who are now taking advance customer deposits on equipment well before an expected delivery date. These funds are being used as working capital to finance R&D and equipment production. The question to ask is if the company is financially healthy, why do they need the customer to function as a bank for the financing of their businesses? Where are the investors and banks? The answer is that the cost of borrowing and the risk of loss to the company is significantly less when customer deposits are used.

Of course, the worst condition occurs when a company exhausts customer deposits and cannot fulfill orders, nor move the company forward as a "going concern." Unfortunately, filing for creditor protection under federal bankruptcy law rarely results in the return of customer's funds unless a reorganization plan is later approved by a federal court.

Now, more than ever, caveat emptor.

Topic: 2038 Message: 2038

I do use mailduster and have had it for 3 years, about as long as I have been on the Acom list. I am not the only one that is on the list who uses mailduster. I changed most of my "inform senders" rules and hopefully this will cure the problem. The only inform sender rule will have a response with my name and call letter. If see this let me know and I will unsubscribe. Give this a few days to make sure my changes take hold. If next week or so, you are still getting mailduster messages, take me off the list but please notify me. If the messages still appear after removing me, put me back on. In the meantime I will email my friend who is on this list and has mailduster and compare settings. Hope this helps.

I suspect that back in February or March of this year, when these anonymous maiduster ads first appeared, mailduster changed their system to anonymously troll for new subscribers.

Not nice.

Yahoo group: acom-list (1999 — 2009)
Date: 2007-06-03 17:12:48 UTC
From: Dick Green
Topic: 2034 Message: 2041

Paul,

Your concerns about the risks of making an advanced deposit and the financial health of companies in the amateur radio market are certainly valid.

But these days it's difficult or impossible for very small companies in very small markets to raise sufficient capital for R&D. In my experience it takes upwards of $750,000-$1,000,000 to bring virtually any hardware product to market, and probably much more for highly complex devices like transceivers.

Banks will advance credit to going concerns for about 75%-80% of existing accounts receivable, plus 50% of finished inventory. That's usually only enough to buy inventory and provide working capital for operations. Venture investors have no interest in amateur radio companies -- the small market and tight margins result in an upside that's too small compared with the risk of failure. Sub-debt lenders generally have the same attitude. Even if professional lenders and/or investors were willing to take the risk, the cost of capital would be very high. At the end of the day, there wouldn't be much left over to compensate the owner for all the hard work and risk.

You can get around some of these factors by focusing on commercial markets, but then you're dealing with much more competition, often from larger, better-financed companies. Even if successful, the commercial focus will necessarily dilute quality in the amateur radio division.

In the old days it was possible to finance companies with one's personal funds and/or money from friends and family, but the amount of capital needed to get a company or new product off the ground has grown enormously in our high-cost manufacturing environment. Oursourcing to places like China can help, but is it desirable? Also, you need enough capital for container-loads or large fractions thereof to make it pay. I'm not surprised that amateur radio companies are turning to their customers for R&D and production financing. Heck, I used to do that at my small software company back in the heyday of the industry, when financing was easy. The customers were large and they really wanted what I was offering to build. Large companies won't do that anymore, for the reasons you cite.

I think the capital situation in the amateur radio market may provide a reasonable opportunity for hams with discretionary funds to invest and a willingness to get involved in the business, at least part-time. Knowledge of the market, a prior relationship with the owner,

and a seat at the table can offset the risk to an extent not possible for arms-length professional investors. Double caveat-emptor on this route! You really need to know what you're doing -- it's not like buying a mutual fund.

I agree that hams must be very careful about putting down deposits in advance of product completion. You could lose all of your money, with virtually no recourse. In a bankruptcy, the best case would probably be 10-cents on the dollar, if you get anything at all. You need to know who you're dealing with and the liklihood that they will be able to deliver.

Bob:

They're not anonymous MailDuster ads, they're spam notifications which are apparently & inadvertantly being misdirected to the list.

MailDuster has not changed anything with their spam filtering for several years now. They do not troll for new subscribers. I have not interest in the company, other than being a subscriber.

Apparently Steve was recently notified by the list moderator of a potential problem, and made changes to resolve the problem. If you have a problem with Steve, or me, or anyone else inadvertantly adding overhead to your mail on this list, it might be better to contact them directly for a solution, rather than ask the list moderator to summarily purge them (also not nice).

Have a great day!

Thanks to Jerry, N8BM, I found the information I needed to build the cable for connecting the ACOM 2000A to the computer.

The Technical Supplement has the following information about the special cable that is needed. Please pay particular attention to the caution in the instructions because severe damage can be caused if you don't.

"b) A "null-modem" type cable is needed for ACOM 2000A and it may be home-made or you can buy it, but all extra connections must be cut.

ONLY(!) the connections listed below should remain connected there because of the +/-18V.

ACOM2000A to PC cable:

female CANNON-DB9 female CANNON-DB9 female CANNON-DB25 Signal Name

(ACOM2000A) (COM1 - PC) (COM2 - PC) ACOM - PC)

nr. 2 nr. 3 nr. 3 RxD-TxD
nr. 3 nr. 2 nr. 2 TxD-RxD
nr. 5 nr. 5 nr. 7 Signal Ground
metal case metal case metal case + nr.1 Cable Shield

NOTE - Do not forget to connect the shield braid on both cable ends!

Please contact ACOM Ltd. for additional information on cabling the Automatic antenna selector ACOM2000S, including the Remote antenna switch ACOM2000SW."

Not that I can find, Andy. I just took the end portion of the original URL and changed the "2000acd.zip" to "1000cd.zip" and it was there. I tried changing it to "1010cd.zip" and didn't find anything. These appear to be zipped images of CDs, so maybe an email to ACOM asking for the ACOM-1010 CD (or sending them the two other URLs) and asking is something similar exists for the 1010 might provide you with something.

Subject: R: Tnx

Hi Stan,

I built the filter you suggested me and I tried it today. It works perfectly and now all problems disappeared.

I'm driving now the Acom 2000A with TX OUT-TX EN signals from the Orion and I can increase QSK delay >20% for proper delay in CW.

On all bands and by varying drive power no Arc fault alarm appears anymore.

I really thank you very much for the suggestion.

Best regards and talk to you soon on the air

Hello Tiziano,

I used to be very active nearly 40 to 20 years ago from various club stations, LZ2KRS, LZ2KRE, LZ1KDP, LZ1KIA. Unfortunately, I am only rarely on the bands lately. The latest time I operated from home it was last Christmas, hi. I hope to be able finding more time for the hobby in the near future, moreover we both are radio amateurs with my XYL Ulyana LZ1VU.

Please inform me about the test with a HPF

Inviato: lundi, 4. juin 2007 10:03
A: Tiziano Christen
Oggetto: HPF

Hello Tiziano,

Thank you for the additional information. I see that in fact you want
semi-break in CW operation (the 0% Delay is full-bk or QSK mode). The
problem appears in the transmission pauses between dots and dashes when the
whole system is in TX mode but with no RF drive.

I suppose that the LF suppression at the Orion output is insufficient.
Adding a filter in the form shown in the file HPF.doc (I sent you attached
with the first letter) should cure the problem in this case. I have heard
that Ten Tec may supply similar filters for their early units.

If you have questions please contact us again.

Subject: R: Dunestar etc

Hi Stan,

Thanks for the new reply.

I have the problem in CW only. In SSB normal PTT is quite slow and does not create any problem.

The Ten Tec Orion is connected with its TX out to the KEY-IN of 2000A and the KEY-OUT of 2000A is connected to the TX-EN input of Orion. To operate without ARC Fault alarm, which appears more on lower bands (1.8, 3.5, /, 10Mhz), I need to set the QSK Delay of the Orion to 0%. This regardless if the drive is low or high. The problem is that with QSK=0 at every dot in CW linear switches to RX. I fear this operating mode will damage the antenna relay very fast.

The Linear does not work only with the normal AMP Key output of the Orion. I have always the Arc fault alarm.

The Dunestar is a band pass filter and therefore it cuts also frequencies below 1Mhz.

With other transceivers such as Kenwood TS870S the Acom linear works fine.

Regards

Tiziano

Oggetto: Dunestar etc

Hello Tiziano,

I do not know the characteristics of Dunestar but I suppose once it is band-pass type, it should suppress also the low frequencies. The suppression for frequencies in the range 100kHz to 1MHz is of special interest.

Please tell me some more about the behaviour when you change bands, modes, drive level etc and also whether you have tried with another model of transceiver. Also, I would like to know how is connected the KEY-IN and KEY-OUT control to the transceiver.

Stan,

actually I have a Dunestar 6 band filter between Orion and Acom, this would already cut low frequencies, isn't it?

Hello Tiziano,

Yes, your unit has the modification readily available. I think that you should try with the High-Pass filter in this case.

My recent 2000A was received in two boxes, a separate one for the xformer. And the xformer was bolted to a wooden platform which fit down inside its box. Perhaps Will or Krassy could send you one.

2061. Acom 2000A for sale

Yahoo group: acom-list (1999 — 2009)
Date: 2007-07-02 12:47:26 UTC
From: Robert Naumann
Topic: 1555 Message: 2061

I'm living in a no antenna neighborhood, and it looks like I'm going to be here for a while, so my Acom 2000A will not be used much.

It is about 8 years old, and it has been updated twice by Acom. It has the auxiliary fan wired to switch on only when necessary and it works.

This amp has been to Antigua 3 times, shipped in the original cartons with the transformer removed, and it has some scratches on it, but it works perfectly.

I also have a spare set of new tubes that have never been installed that will go with it. I have the original manuals.

Please contact me directly if interested. I can ship it via insured UPS if necessary.

You need several things, due to the special design of the ACOM 2000A interface. First, you need to use either a null modem cable or a null modem adapter and a standard DB-9 cable.

Second (AND THIS IS TERRIBLY IMPORTANT) you have to disable all of the pins expect 2, 3, and 5. The important reason for this is that one of the other pins has 18 volts on it. Failure to disable this pin will smoke anything that is connected to it. The technique I use is to pull the pins out. To do this, you need to make sure that you install those little special nuts (or something else that is suitable) so that you don't destroy the connections to pins 2, 3 & 5. If you don't do this, you will destroy the entire plug (the voice of experience).

You should also know that AcomTools doesn't work reliably under Windows XP. Most of us had to stop using it when we upgraded to that O/S years ago. There's been no maintanence on the program for about 5 years.

2067. Auto Ant Selector / Remote Ant Switch / 2000A - Only Works Manually

Yahoo group: acom-list (1999 — 2009)
Date: 2007-07-19 20:27:34 UTC
From: Ralph
Topic: 2067 Message: 2067

I'm trying to get the 2000S antenna selector and switch to work automatically and follow the 2000A band changes. So far no luck but works fine manually.

There was some confusion on the correct serial cable from the 2000A to the antenna control box. Will @ ACOM said I need just a straight thru 9 pin. The modem null cable is not needed since I'm not using a PC.

I have the RCU menu set for Ant Selector ON. I have the RCU A1 A2 A3 etc programmed for each band. No response at all from the antenna switch or selector when changing bands. It like the serial cable is not even connected.

If anyone has any experience or knowledge with this and can assist me, I would really appreciate it!

As fara as I know the main differences to be concerned about
are that the 1999 model will have a noisy QSK relay which is silent in newer
(after 2002 models ?) and it also may have the old filament connectors
in it that were prone to go bad (overheat and burn) if they haven't been
already upgraded.

I know of no other concerns and if you don't run QSK when you are
running CW, then the noisy QSK relay is not an issue

2072. Microprocessor Conflict Error

Yahoo group: acom-list (1999 — 2009)
Date: 2007-08-03 22:35:37 UTC
From: ki4ge
Topic: 2072 Message: 2072

I recently purchased a new ACOM 2000A amp and started to power it up for the first time today. After I turned on the power switch and pushed the ON/OFF button on the RCU the initialization began and the countdown started. However, when it reached 138 seconds remaining the PROT light came on and MICROPOCESSOR CONFLICT was displayed on the LCD display and initilization stopped. I followed the instructions in the manual and turned the system off for 5 minutes. When I restarted the system again the same thing happened again.

I then use CLR and Erase Nonvolatile Memory in an attempt to reset the microprocessor and then tried to restart the system. It went through the same sequence again, stopping when the PROT light came on and MICROPROCESSOR CONFLICT was displayed on the LCD display.

I have sent an email to ACOM describing the fault. Any other ideas for me to try in the meantime?

Hello KI4GE,

I had the very same problem with my 2000A.
It turned out to be a shorted (leaky) capacitor (C6) on the
CPU board inside the 2000A. This board is behind the interface
board and is kinda hard to get to.

Good Luck...

Thanks Ted and Peter for the suggestions.

After further troubleshooting, I found what the problem was but I have not yet found out why it was a problem<g>.

I had a specially modified null modem cable connected to the RS 232 port on the linear (only pins 2, 3, and 5 remain - all other pins were removed). The cable was not connected to anything else, just the linear. After I removed this cable, the linear operated normally.

When I have some more time, I will try to figure out why this cable caused the Microprocessor Conflict problem.

It is now working fine. I really like the amp.

Thanks for the help.

Probably a short in the cable.

Although I haven't used the serial connection for several years because
Acom Tools is flaky under XP, it worked great with Win98.

i may have had the similar error , after i disconnected the basement serial
from the computer. . and I also disconnected the end at the amp, and the
error went away.
The amp IS remoted from the basement, so the antenna lines as well as
control all run parallel. Small chokes did not clear the problem for me.
But as mentioned before, not an issue till someone writes decent control
software......

From: Ralph
Topic: 2072 Message: 2079

I had the same problem here. The modem null cable was not wired
according to ACOM specs.

I'm still trying to get the ACOM antenna selector to follow the
amp. It only seems to work using the manual switch. No luck yet.

Thanks Ralph,

I wired the null modem cable in accordance with the instructions in
the Technical Supplement. When I get a chance, I will double check
everything to make sure it is wired correctly and is not shorted.

The following keys no longer function on my RCU.

Left arrow
Up arrow
Enter
OPR / STD

Anyone else has this type of problem and if what was fix?

Removed connectors from amp and RCU as well as reinstalled eprom,
however no luck.

Also, tried ACOM tools withno luck, however I had never used ACOM tools
before.

Concerning ur special problem You should write an email to Stan in Bulgaria, using the email address of acom-bg.com for support. His English and technical service is excellent and he knows each detail of the amp. He is very cooperative.

2083. anyway to stop beeping when I use 200 wattts in standby mode ?

Yahoo group: acom-list (1999 — 2009)
Date: 2007-08-13 16:32:14 UTC
From: va2nrj
Topic: 2083 Message: 2083

Hello

I really love my acom 2000A

I try to find a solution for this troubble:

I usually set my ICOM 7800 for 10 to 20 watts to excite the Acom 2000A
But when I don't want to use my amplifier, I just switch the amplifier in Stand by mode and ask the 7800 to have the full output (about 200 Watts)...Then the acom beep and beep and beep again telling me that I have to reduce my power...
Is there anyway to stop the beep and stay in stand by mode with 200 watts ? even in a hidden menu ?
Or do I really need to power off the amplifier then power on when I need it (and so wait 150 second every time)

Sorry for my poor english

VA2NRJ in Montreal

From: lewischeek
Topic: 2084 Message: 2084

Looks like my RCU has failed, does anyone know process to run amp without having RCU connected?

ACOMTOOLS appears to function once I turn amp on via way of ON/OFF button on RCU. At this point my comm port will connect and I can switch between Standby and operate.

I disconnected RCU from 2000A and installed a switch between pins 1 and 5 of DB-9 connector intalled on RCU port. I hear a relay click when contacts close, however amp does not power up.

Any help out there?

2085. ACOM1000 drive power

Yahoo group: acom-list (1999 — 2009)
Date: 2007-08-16 14:44:02 UTC
From: Brian A
Topic: 2085 Message: 2085

The new ACOM 1000 here has resolved a curious observation.

For some reason, all the amps I've had here seem to have needed more drive for the same amplifier output on 20M.

Problem turned out to be with the metering of the exciter. On 20M, the same power setting produces 10-15 fewer watts than other bands. On 6M the exciter puts out 30% less power. Apparently, the exciter output (for the same "power" setting) varies considerably from band to band.

Being able to monitor gain and drive power with the 1000 cleared up my errant observation. I'm not now concerned with cranking up the 20M drive to whatever it takes.

Another observation. Comparion of the Autek WM 1 indicated power with the ACOM1000 is within a few percent on 40-10. On 80 and 160 the AUTEK indicates 12% and 19% higher power. I don't have a clue which is right. The SWR of the antennas used on all bands was <1.2:1. Anybody checked the ACOM1000 output power on 160/80 with a dummy load/wattmeter?

From: billdz.geo
Topic: 2086 Message: 2086

I've suddenly been getting an intermittent arc fault when using my 2000a, so I did a search of this reflector and learned that the arc fault issue has been discussed many times. Despite reading all of the old posts, I'm still unclear on 2 things:
* What exactly is the ACOM measuring or sensing that triggers this fault?
* How is it that a transmission line/antenna system with a 1.1:1 swr can trigger the fault? The old posts make clear that the most common cause of this fault is a bad connector or coax. Would not such a defect result in high swr?

Bill,

If the arc "finishes" and burns a carbon path it may cause a bad swr
situation that you would see under all circumstances.

If it is just arcing, the arc only occurs when you transmit at a high enough
power level and then appears to be normal when you stop transmitting, or
lower your power output.

I think that in most cases, when the amp tells you that it is detecting an
arc, there is one occurring somewhere between the output connector of your
2000A and your antenna.

Have you tried a different antenna or a dummy load?

73,

Bob W5OV

2090. Re:Arc Fault revisited

Yahoo group: acom-list (1999 — 2009)
Date: 2007-08-22 12:29:58 UTC
From: Hal Kennedy
Topic: 2086 Message: 2090

Bill,

The amp senses arc faults at its output. A high pass filter, which will only pass fast transients (not RF up to 28 MHz) is sent to a comparator circuit and that's how it works. Detected transients can either be from momentary shorts or momentary opens - both produce fast transients. Transmission lines operating at 1:1 SWR can have intermittents in them - it happens all the time. Common causes include poor/bad solder joints that go "open" when the wind blows things around, branches touching dipole or other wire antennas (happens here frequently), PL-259s where the braid is almost in contact with the center conductor, etc. The last one I mentioned can be temperature sensitive. I had a two foot jumper outdoors that would intermittently short when the temp got below about 40F. Indoors I could never get it to fail. Other's advice is good advice - using a coax cable that is known to be good and a dummy load - see if your amp still arc faults. The cable should not be one you normally use in your station layout. If the amp still arc faults, it might be time for a tube replacement - but most of the time the amp is telling you the truth - something "out there" is going open or shorting on a transient basis. There are a few people who insist that you don't have to solder the shield on a PL-259 BTW - you can just twist the things on. This is a great way to create arc faults a few years down the road after the wind and your rotor have twisted the fitting for a while. I use a lot of open wire line transmission line here - through the woods. "Arc fault" here usually means; "go out and find the branch that is laying across the transmission line." Frequently a branch can lay across the lines here for days or weeks without problems - until it gets wet, or the wind shifts it just so, etc, etc.

From: jwsco3
Topic: 2091 Message: 2091

My Acom 1000 is currently configured for 240 VAC, I need to move my gear to another area of the house for a period of time, since it is only temporary I would like to run the amp on 120 volts. My problem is that I do not have the chart showing how to configure the jumpers and transformer taps for 120 volts, my amplifier was made sometime after 2004, and has the screw terminal strip labeled 84UVWWXXXX, and the low voltage jumpers A and B 1-5. The manual I have is for an older model amp, and the technical supplement available from HFPower is also not current. Can anyone supply me with the information to configure this model amp for 120-125 volts?

Thanks
Will K5FM

From: Will Shinhgleton
Topic: 2094 Message: 2095

You probably should consider just running the amp on 120 volts, the 208 is three phase, the Acom has a single phase power supply. The reason the building is specified as 208/120, is that each phase of a 208 3 phase circuit refrenced to the neutral is 120 volts single phase. Commercial building will bring in three phase power for running large motors, such as in machinery, or HVAC, and then split the 3 phases into 120 volt single phase lighting circuits. Someone else that is a EE can probably do a better job explaining this than me.

2096. RE: [acom-list] 208 V three phase

Yahoo group: acom-list (1999 — 2009)
Date: 2007-08-30 00:11:36 UTC
From: Robert Naumann
Topic: 2094 Message: 2096

Will,

You're correct about the 3 phase, but I think your conclusion needs to be reconsidered.

Running the 2000A on 120v would draw over 20 Amps - easily. This is not good.

Since Hal is going to open it up anyway, he may as well set it for 200 or 220v. I would measure the 208v in the building (phase to phase) to see what it actually is since it can vary up to +/- 10% and then select the closest taps.

73,

Bob W5OV

Subject: Re: [acom-list] 208 V three phase

You probably should consider just running the amp on 120 volts, the 208 is three phase, the Acom has a single phase power supply. The reason the building is specified as 208/120, is that each phase of a 208 3 phase circuit refrenced to the neutral is 120 volts single phase. Commercial building will bring in three phase power for running large motors, such as in machinery, or HVAC, and then split the 3 phases into 120 volt single phase lighting circuits. Someone else that is a EE can probably do a better job explaining this than me.

I missed the one detail, that you were refering to a 2000a, I was thinking it was the Acom 1000 you wanted to run, sorry about that. You are right, you would want to use something other than the 120 volts.

2099. 208 V three phas

Yahoo group: acom-list (1999 — 2009)
Date: 2007-08-30 12:00:45 UTC
From: Hal Kennedy
Topic: 2099 Message: 2099

Thanks for all the on and off reflector answers. Here is a little data for
those who are not familiar with three phase power. Each leg in a three
phase system, normally called A, B and C, presents 120 VAC to neutral and
208 VAC from A to B or B to C or A to C. What you see in each case is a
sinusoid ☐ usually referred to by electricians as single phase. There is no
☐two phase☐ power and there is no way to wire-up a 120/208 three phase
system to make 240 VAC without a step up transformer. Its perfectly okay to
connect an amp between any two of the three legs ☐ but you will have,
nominally 208, volts which is between the available 200 and 220 taps in a
2000A. K1ZZI gave me some good advice ☐ measure the building ☐ then pick
the closest tap. If it☐s 208 or higher I☐ll try the 220 tap. Below 208 I☐
ll go with the 200 tap. This should work fine ☐ Ill post the results.

Date: 2007-08-30 12:47:57 UTC
From: Robert Naumann
Topic: 2094 Message: 2100

Just to be clear, using only two legs (not three) of 208 3 phase power is
(for our purpose) 208v single phase.

A transformer that can produce 240v single phase from 208V at the current
required for the 2000A would be very expensive. Often, you may find that a
120/208 3ph building will have such a transformer for powering special
equipment that requires 240v single phase, and if it is there, by all means
use it. But for a temporary use like this, the cost would be prohibitive.

I have used a 24 Volt 25 Amp transformer to boost the 208 to 232 volts which
then powers the Amp quite well.

2102. 208V 3 ph

Yahoo group: acom-list (1999 — 2009)
Date: 2007-08-30 14:30:39 UTC
From: Gerard Jendraszkiewicz
Topic: 2102 Message: 2102

These transformers buck/boost are available from a variety of electrical supply houses. Look at www.grainger.com for a idea on size and price. From the Grainger web site:

* For Single-Phase and Open Delta 3-Phase Circuits (3 Hot Wires With No Neutral.)
* Determine: 1. Difference in voltage required (pick one: 12, 16, 24 or 32) 2. Multiply by circuit amperage = subtotal 3. Multiply subtotal by a safety factor of 1.2 = total VA Example: 24 Volts x 20 Amps x 1.2 = 576VA Recommended transformer 750VA or 0.75kVA (No. 1H279)

YMMV

From: Barry
Topic: 2103 Message: 2103

Since I sold one of my 2000A's, I no longer need this cable. It is to connect the 2000A to a computer COM port, for use with AcomTools or other (if it exists) control software. Cable is about 5 ft long and has female DB9's on both ends. Includes connections for only the 3 pins used, so can't be used as a serial cable for other hardware. $10 shipped in the US.

2106. Maximum AC Voltage - ACOM 2000 - UK spec

Yahoo group: acom-list (1999 — 2009)
Date: 2007-09-06 21:12:50 UTC
From: Callum M0MCX
Topic: 2106 Message: 2106

I noticed at the weekend that my new generator is kicking out just over 250V when not under load. I ought to find the service manual because one of the ACOM lights flashed (can't remember which one) as an alarm. I guessed it was voltage related because it started as soon as we switched to generator power for the SSB Field Day Region 1 contest. On transmit, there was enough load to bring the voltage down to 256V which stopped the flashing alarm condition.

Amp: ACOM 2000A - few weeks old.

Anyone?

Topic: 2106 Message: 2107

Hi Callum,

you say ...

a. is kicking out just over 250V when not under load.
b. On transmit, there was enough load to bring the voltage down to 256V

This does not make sense ...

The voltage is 'harmonised' in IEC 60038: Up to 1987 in DL the voltage was 220 V with a tolerance of ±10 %. After that it changed to 230 V +6 % and -10 %. Starting in 2009 it can be 230 V ±10 %.

Are you sure the generator is putting out a real sine wave? Only 'inverter type' of gen sets will do this. If it is not a real sine wave you will have problems to measure the exact voltage (with a 'normal' meter) ...

That's it Bill, the heater light blinks!

I *think* it's a real sine wave, I'll need to get a scope on it.

By the way I think I made a typo; under heavy load, the voltage starts to drop down to about 246, not 256. Under really heavy load (more than 5kW, it drops down to 220V.

Anyway, will this cause a problem? It worries me.

From: Barry
Topic: 2112 Message: 2112

Hi all,
FYI, I have been the moderator of this list, since I started it in July, 1999. Currently there are 336 members.

I'd like someone else to take over the (minimal) housekeeping chores. Basically, what's needed is someone to approve new memberships and weed out any spammers attempting to join. On average, there are 1 or 2 new membership requests each week and I approve 95% based on the initial intro message. Occasionally, I ask for additional info, such as callsign or what's an Acom, to verify the subscriber's intent. That's pretty much it.

Pse email me directly if you're interested.
Tnx,
Barry, W2UP
P.S. No, it's not true I get a free amp every year for running the list :.)

2116. how to identify a "mad" tube ?

Yahoo group: acom-list (1999 — 2009)
Date: 2007-09-24 11:50:55 UTC
From: dl1amq
Topic: 2116 Message: 2116

Hello from a satisfied ACOM2000A user.
My question is: how to identify "mad" tube(s) in ACOM2000A ?

I got informed on the band about "bad signal quality". Listening with a second RX it sounded like RF impact into the radio, but was n't. The same signal appeared with RF-generator as a source and dummy-load together with the PA. Checking the PA, all measured values were o.k., no indication regarding "mad" or "daed" tube(s).

Exchanging 1 tube (selected by try and error) the signal was clear again and all went ufb as before.

So once more: how to identify "mad" tube(s) in ACOM2000A ?

Thanks in advance.
73 de Thomas, DL1AMQ

2117. Re: [acom-list] how to identify a "mad" tube ?

Yahoo group: acom-list (1999 — 2009)
Date: 2007-09-24 12:04:26 UTC
From: Brian Alsop
Topic: 2116 Message: 2117

That is a good question.

Other questions:
1) How does one "burn in " a new tube without getting a trip? In other less protected amps one simply removes the plate cap and cooks the new tube with filament voltage for several days. I believe neither the 2000 or 1000 permit this. Given that many of us have obtained older "surplus" spare tubes, gettering them would seem to be necessary before applying plate voltage. Only other alternative would be to set up some kind of exterior breadboard with tube socket (or perhaps clipleads) and filament transformer.
2) Can one test one tube at a time in the 2000 by simply removing the other tube and applying a small amount of drive?
I don't believe this can be done either.

Perhaps there are some undocumented ways to bypass certain trips?

Hello Thomas,

Here another (very) satisfied 2000A user.

I got some audio reports with a little bit distortion on my modulation. Especially during no-voice periods during transmission. Nearby stations talked about a 'ravel'. It sounds a bit frayed, like RF-impact. It only happens for a very short time. Some people don't hear it at all.

Is this the same distortion as you had?

IMHO this could happen with some tubes. Others told me that triode tubes like the 3CX800 don't have it.

yes, You are right, om Hans.
But the "ravel" did not disappear on my side, sorry. Of course, the modulation was still in a manner to get into the 3B7C log several times - but it was not comfortable to know that the signal is not "Q9". May be that the "ravel" is an indication for "mad" tube(s). But, do we really have to wait for certain modulation reports to learn about "mad" tube(s) ??

Hello Thomas,

Did you replace both the GU74b with other GU74b's or with Svetlana 4CX800?

Were your new tubes formatted?

Topic: 2121 Message: 2121

Acom 1000 ERROR CODE....

Still got that small problem with the amp on warm up - switches off while going thru all checks - says SB26 code! I can still fire it up by re-starting a couple of times ..... then it goes fine!

A friend down in NZ keeps getting this Code, any help?

Yours Sincerely,

Bill Beyer/N2WB

Hi all
This below may answer the question. I had a similar one some time ago to Stanimir from ACOM Bulgaria who is a fantastic help btw, about the selection of the correct pair.
He said that simplest way of doing selection of the right pair (or one could read as identifying the "mad" tube?) is to compare the air flow tempratures for both tubes, which you can find in the menu through MEASURE, TEMP-F (front) and TEMP-R (rear).
If pair is selected properly the difference bewteen temperatures should remain within 4-8 degrees (6 and less is considered as excellent). 10-12 degrees is still OK to work but pair is not the best one. If you have more than 12 degrees pair is not good you need to find a replacement or at least to work at a reduced power before you find one.

One thing to pay attention before the test is done is that there is no
gap between silicon tubes over the lamps and metal base so you don't lose air through hence wrong measurement. as well as temp sensors are properly placed.
Hope this is helpful info and may give good indication on if one of the tube is "wrong", which if that's the case should show a higher air temreature than the another one.
all the best

I agree with the tube temperature indicator. I was having a problem with my amp about 6 months after I purchased it. It was shutting down after a short time of operation with some very odd behaviors. I had noticed that my tube temperatures were running about 10 or so degrees apart from each other, when they had been about 2 to 3 degrees in difference prior to my troubles. The amp finally decided to not operate any longer, and Krassy came over for a visit with a box full of new tubes.

We ended up swapping out pairs of tubes until we found a pair that was very well matched based on some voltage readings, at which time Krassy did some alignment adjustments of various pots in the amp, and it fired right up like normal. I then measured the temperatures of the tubes and they are just about exactly the same with not more than 1 degree difference.

2124. Tubes - Bad and otherwise

Yahoo group: acom-list (1999 — 2009)
Date: 2007-09-25 13:08:36 UTC
From: Hal Kennedy
Topic: 2124 Message: 2124

Seemingly good but not really good tubes can often be spotted by going into the measurements menu and watching "bias" with the amp in operate (not standby) and the tubes hot (operated for a while). It should sit there at -127V. If it wanders around, one of your tubes has started going.

You CANNOT burn in a 4CX800A with clip leads on the filament pins. The filament pulls about 50 watts and you run a significant risk of damaging the filament pin seals. The tubes should only be operated in sockets with air moving. You can try it - put clip leads on the filament pins and power the tube up - in 30 seconds the filament pins are so hot they will burn the skin off your fingers.

Burn-in for gettering purposes is used to prevent arc-over due to non-captured gas being inside the envelop after years of sitting. Meanwhile, the 2000A HV runs around 1.4KV and the tube is rated for 4 KV. I have never had a "new old stock" tube from the early 1980s give any trouble at all just dropping it into the socket and turning it on. If you really want to age the tube in some, just run it in the amp with the amp on standby. 1.4KV is so far below the peak rating of the tube that its unlikely it will flash over. If you drive the amp - the peak voltage at the anode can be quite high - so just let it sit a while with no drive - hours, not weeks!

73,

Hal N4GG

Hal,

Where do you get 1.4KV? I don't remember what it was on the 2000 but
the 1000 is 2.8KV in standby. I'm sure the 2000 is at that value or
more. Hence, my concern about gettering with high voltage applied.

2127. RE: [acom-list] Re: how to identify a "mad" tube ?

Yahoo group: acom-list (1999 — 2009)
Date: 2007-09-26 09:11:43 UTC
From: Thomas Herrmann
Topic: 2116 Message: 2127

hi all,
temperature difference between front and rear tube seems to be a good indication.
To test it, I reused the tubes as I did it for a long time and finally got the trubble.
Temperature difference after transmitting in FM of abt. 3 minutes was 20°C. After replacing the tube with higher temperature by another one, but not a new one and not a paired one, I repeated the same test and got a temperature difference of 4 °C only. Temperature differences only appear during TXing, not while stand by. And the temperature difference raises with the time of TXing, so while "normal" CW operation with short TX periodes temperature differences are hardly to detect.

Thank You for all responses regarding my question. I hope the discussion will help also all the other ACOM2000A users.

2128. ACOM Tools 1.5

Yahoo group: acom-list (1999 — 2009)
Date: 2007-09-26 23:42:58 UTC
From: ki4ge
Topic: 2128 Message: 2128

Has anyone been successful using ACOM Tools 1.5 to control an ACOM 2000A with Windows XP?

If so, how did you configure XP to get it to work properly and provide stable and consistent operation?

If no one can get XP to work with ACOM Tools, I am considering setting my computer up for "dual boot" with XP and WIN 98 SE. Is it worth the trouble?

Will ACOM Tools be stable and reliable operating under Win 98 SE?
Has anyone been successful using WIN 98SE to control the ACOM 2000A?
If so, are there any tricks I need to know to get it to work properly.

I need to have a software program to control the ACOM 2000A because I control my station remotely over the internet. I have everything working fine over the internet, except the ACOM 2000A.

Is there another program that will work with the ACOM 2000A under XP?

Thanks for any help you can provide.

Jerry, KI4GE

2129. Tubes - Bad and Otherwise

Yahoo group: acom-list (1999 — 2009)
Date: 2007-09-27 00:00:47 UTC
From: Hal Kennedy
Topic: 2129 Message: 2129

Oops. Sorry about that. The HV in a 2000A is 2.4KV not 1.4KV - my mistake.

The GU-74b/4CX800A is rated at 4KV anodes voltage, and if it were a US designed tube it would have significant margin above that. WRT Russian designed tubes, I have no idea if there is a lot, a little or no margin at all. I have had no problems simply putting 1980s GU74b tunes into the 2000A, letting them sit in standby for a few hours and operating them. Your mileage may vary!

You don't need one.

The Pro III works fine with the 2000.

I have never had a second's problem using the Ameritron unit with the ACOM 1000, ACOM 2000A, or Alpha 87a -- exciters FT-1000 Mark V and Orion and Orion II. I reccommend it.

Howevr, there are two other places you could check: DX Engineering and Array Solutions.

Agree.. you don't need an interface. Although Icom has the most puny linear interface of all the manufacturers - even it will drive your 2000A direct. Just don't hook a Henry 3K to it!

2134. Acom 2000A how the time has passed

Yahoo group: acom-list (1999 — 2009)
Date: 2007-10-13 15:27:44 UTC
From: kamarty456
Topic: 2134 Message: 2134

Wow! I just realized I have the 2000A over 6 years now!!!!!
It is hooked up to my Icom IC-775DSP and Sommer XP707 antenna.

I have had some issues with the amp over the years, but more times than not the amp was notifying me of antenna/coax problems. Yes, I have had my share of "arc-fault" alarms. Every time it turned out to be a bad pl259 that has deteriorated, a bad right angle UHF connector, a bad antenna switch [alpha delta-4 I now use the ICE model 516R/G switch without a single problem], or a piece of coax has failed.

In the early ownership of the amp I did have a power supply fail. Acom addressed this immediately!!! I should add here that the first four years of owning this amp I received a Christmas card from them! A class act!

Around October of 2006 I encountered some shut down issues due to reduced air flow....I contacted Acom and was able to address it here without sending the amp in for service. The amp inside is clean as I keep the external filter clean. I wash it every 3 months..it's dusty here in Arizona. I guess as components age their tolerances changed slightly and I adjusted the air flow sensor. A few tweaks and tests and I'm back to 100% operation.

I am using the original tubes!

I do have an ICE model 338 240v dedicated surge protector in in the power cord line. This has saved me a number of times when our power hiccupped!!! I had to replace a 30amp fast blow fuse in the ICE unit and not a single challenge with the 2000A!. I strongly suggest you install surge protection..as the amp is almost bullet proof it still does not like "dirty power"

In summary, I am really delighted I decided to buy the amp back in early 2001. Yes it was a significant investment, however, you get what you pay for.

I am looking forward to many more years of reliable operation...Thanks Krassy and crew for producing such a nice amplifier.

Marty, KA7GKN

From: ki4ge
Topic: 2136 Message: 2136

Good news about new software for computer control of the ACOM 2000A. This software was developed by Laurent Laborie, F6DEX, and is included in TRX-Manager version 4.1.6 which was recently released.

The message from Laurent is included below. 73, Jerry, KI4GE

"Hello"

"TRX-Manager V4.1.6 is available from http://trx-manager.com/whatsnew.htm"

"V4.1.6 supports FT-450 and includes a sophisticated support of ACOM2000A amplifier via a distinct application TRX-ACOM (trx-acom.exe installed in TRX-Manager's folder)."

"TRX-ACOM was developped with extensive support of Stan LZ1IU at ACOM Bulgaria. I and we must thank Stan for the time and care to test this program."

"Special thanks to Rune LA7THA for giving me access to his remote site in Norway and allowing me testing this marvelous amplifier directly from France!"

"For those - like me - who don't own an ACOM2000 I wrote a new module : the Linear Reminder which helps you using your manual mplifiers safety."

"Enjoy !"

2137. Re: [acom-list] ACOM Tools 1.5

Yahoo group: acom-list (1999 — 2009)
Date: 2007-10-21 01:43:28 UTC
From: Ron NØAT
Topic: 2128 Message: 2137

I use ACOM Tools 1.5 with XP. I did not install it, I copied the .exe file to my computer and created a shortcut to it. I click on the shortcut to start it.

I use ACOM Tools with Writelog, Writelog has to be running before I start ACOM Tools. I do not use the ACOM antenna tuner, just the amp.

My only complaint, is if I am on a split frequency operation, the amplifier keeps going back and forth from the receive frequency to the transmit frequency.

Yesterday I downloaded TRX-Manager with this new feature.

IMHO:

It looks good, but does not give extra functionalities then the old application from Acom.

I had hoped that I could see more than two measurements with the new feature "at a glance of the eye". But you still have to setup every time you want to read another measurement.

It's nice for TRX-Manager users who use the 2000A. But not for 2000A users who did'nt use TRX-Manager before and are looking for more features of their amplifier through a computer application.

the way i read it it is free standing....however you need to have
"installed" trx,.,,
"
RX-Acom is a little but sophisticated application delivered with
TRX-Manager. It allows controlling the more important functions of
your <http://www.acom-bg.com/>ACOM2000A amplifier :

TRX-Acom may also be used as a stand alone program (but installation
of TRX-Manager is required).

TRX-Acom has been written and tested with an extensive support from
<http://www.acom-bg.com/>ACOM Bulgaria (Stan LZ1IU).

....

i guess i'll just have to load er up today

Dear Hans

I have installed the new software and tested, and believe it gives so many functionalities that was not included in the erratic Acom Tools...as example:

You can read all the parameters of the amplifier
You can pre-set the automatic tuning and automatically adjust the power for tuning and normal operation
You can read the band sector
The respons of wattmeter is much better then Acom Tools
If you use in connection with Trx-manager the amplifier is following the rtx so no more rf sensing when you change the band and/or frequency.

I suspect that you have NOT explored all the menus of the application.

I am a proud users of THREE Acom2000 amplifiers manly used at my remote stations and I am really glad that finally the software management of Acom has been solved by TRX-Manager.

Hello Natale,

Thanks for your reply.

Following the transceiver is a very nice feature!

But are there functionalities that I cannot do or read from the Remote
Control of the Acom 2000A?
From a computer application you would expect that, e.g. reading all (or
at least: most of) the measurements.

Hello Natale,

I discovered the 'more commands' and the extended menu after I
downloaded the TRX-Acom, but I don't see all the amplifier parameters.

The 'more commands' menu shows 'auto tune', 'logs' and 'tests'.

On the left side of the window underneath 'Measurements' I only see two
values, and not all of them (or most of them) together.

(Important: while in Measurements mode, TRX-Acom stops reading the RCU)

What I see is about the same as the features of the RCU and what I had
expected of TRX-Acom was a total overview of all (or most of) the
Measure values.

I just returned from travel to Europe and had my first chance to use TRX-ACOM to connect to my ACOM 2000A. The software was easy to set up and it worked great. I have access to all of the major features I need to control the amplifier over the internet except control of the ON/OFF feature. I plan to work on that in the near future.

The software works with no problems with the ICOM 756 PRO III on my XP computer. It also works fine over the internet with very low latency (delay) on a high speed DSL connection.

Thanks Laurent for providing us with much needed, quality software for controlling the ACOM 2000A. Now, this is truly a high quality, high performance amplifier that is idea for internet or remote control applications.

2151. FT2000D generating a forward spike making my ACOM 2000A drop to standby

Yahoo group: acom-list (1999 — 2009)
Date: 2007-11-08 22:50:05 UTC
From: jhk40
Topic: 2151 Message: 2151

My Acom2000A is three weeks old but upon keying up on SSB the RCU unit returns to the standby mode (same thing with a dummy load). This "drop out" is due to the Yaesu FT2000D sending a forward spike to the protection circuit within the Acom 2000A. Tried many things suggested by Stan at the factory. Only thing that seems to help a little is the Heil FS2 foot switch that creates a few millisecond delay to the tranceiver and allows the amplifier to fire up or turn on first. Today,Yaesu suggested I purchase an "amplifier sequencer" that works like the foot switch. I am unable at this point to find a sequencer anywhere. I am well aware that there are many FT2000s out there driving an Acom 2000A and I am looking to perhaps inquire what was done to not allow the amp to return to the standby mode as often as I'm seeing. The problem as explained by Acom is not in the antennas or the feed lines but in the output of the Yaesu FT2000 generating this forward spike. With my other amplifiers like the 30S1 or the 3KA Henry there is no reset mode and will run until flames come out. If you have an idea, I can e mail you the many many things that were suggested that I actually tried. I welcome your suggestions where they may be somewhat different from all that I tried. Thank you, Joel Kornreich, K2QBV (k2qbv@optonline.net)

2152. Bias too low at power on: -000V

Yahoo group: acom-list (1999 — 2009)
Date: 2007-11-17 23:14:05 UTC
From: N1EU
Topic: 2152 Message: 2152

Out of the blue, my 2000A now quickly flashes "Bias too low at power on: -000V" after the 2-minute warmup and shuts down.

Has anybody gone through troubleshooting the same error message and received instructions from Acom?

Thanks & 73,
Barry N1EU

2153. RE: [acom-list] Digest Number 756

Yahoo group: acom-list (1999 — 2009)
Date: 2007-11-18 15:15:01 UTC
From: Hal Kennedy
Topic: 2153 Message: 2153

Possibly a bad tube Barry. My amp was tripping off occasionally with a bias too low alarm. I could watch the amp in standby, and the bias was always stable - I forget the value now - something like -147 V. In "operate" the bias would not be stable and wander around - sometimes getting low enough to trip the amp back to standby. I replaced one tube and that cleared it up. You may have a shorted grid..

2155. Re: FT2000D generating a forward spike making my ACOM 2000A drop to standby

Yahoo group: acom-list (1999 — 2009)
Date: 2007-11-18 19:06:01 UTC
From: mgh.friedrich
Topic: 2151 Message: 2155

Dear Joel,

if I understand your mail correctly, the FT-DX2000D produces RF spikes immidiately after pressing the PTT of the TRX, for instance a usual foot switch. The ACOM2000A needs about 6 milliseconds for switching the RF input from the "Go thruline to the Antenna connector" to the internal 50 Ohm 100 watt dummy load of the ACOM2000A.
I wonder, that Stan was not able to help you. He has very much technical competence.
I recommend the following test:
1. disconnect the microphone
2. set mic and power of the FT-DX2000D to 12 oclock
2. set the ACOM2000A for operation on the desired frequency
3. connect the KEY-IN line of the ACOM2000A permanent to ground
After this push the foot switch and watch the LEDs for forward power of the ACOM2000A. The LEDs held the peak output for a while. If any output of the ACOM2000A is indicated, you have isolated the problem to the FT-DX2000A. There m u s t be the fault, because under those conditions the ACOM2000A will only produce output,if there is any RF input on the ACOM2000A. Without mic and in that configuration the FT-DX2000A should not deliver any RF (spike). If no RF output is indicated under those conditions, it is ok. Then pse send me a mail to proceed with the next step.

As sequencer I use the microkeyer MK2R from microham with great success. Look on the Yahoo group for evaluation. It is designed for 2 radios. The microkeyer from microham is similar and should do the job for delaying the PTT of the transceiver while keying the ACOM2000A first. I use the MK2R for protection of my IC-7800 connected to a ACOM2000A, because the IC-7800 has no feed back line from the ACOM2000A to the TRX. This line goes to ground, when the ACOM2000A is ready to process any RF input. All major Yaesu transceiver are using the "TX inhibit"-line for correct sequencing. The sequencer or the correctly used transmission inhibit feed back line avoids 100% hot switching of the ACOM2000A.

I do not know the FT-DX2000D, but the Ft-DX9000D. Is there any menu parameter in the FT-DX2000D like in the FT-DX9000D for the time delay ? (if so, set it to 15 milliseconds)

So I cannot solve your problem but the microkeyer from microham will solve the problem. Its disadvantage: You need a PC for controlling the microkeyer by USB.

Thanks much for all the help. I'm all set with sources to replace the 4CX800A(s).

It does seem that I also need to rule out one other possible cause of the "bias too low" alarm" before replacing the tubes. If anyone has the R5 photos that Stan references (below), could they please email them to me?

Thanks/73,
Barry N1EU

2158. Power cycling the ACOM-1000

Yahoo group: acom-list (1999 — 2009)
Date: 2007-11-19 17:47:21 UTC
From: Paul M Dunphy
Topic: 2158 Message: 2158

I have an ACOM-1000 that has exceeded my expectation by far. This question is basic electronics, and I'm asking it in the context of the ACOM-1000, not radios, computers, etc. I use my station most of the day, from about 8:00 AM until midnight. This is done occasionally as in I'm in and out of the shack, and doing other things such as email, etc. Now and then something shows up on the DX Cluster I need, or I just decide to play radio for an hour or two. I may go 2-3 hours without using the amp ☐ even 4-5 hours if I don't need the extra power.

I have been turning everything on in the morning and then turning it off around midnight. In terms of wear and tear on the ACOM-1000, as well as the life of the tube, would it be better to turn it off for the 2-3 hour periods when it is being used, or to leave it on all day as I have been doing? I know the off/on cycle stresses components, especially tubes, but so does leaving a piece of equipment running 15-16 hours a day.

2159. autotune settings forgotten on power down

Yahoo group: acom-list (1999 — 2009)
Date: 2007-11-20 05:49:42 UTC
From: Dick Green
Topic: 2159 Message: 2159

Hi,

My 2000a seems to be forgeting its tuning parameters across a power down/up cycle. The USR slots I previously programmed for each antenna are still there, but the tuning is wrong. For antennas that are far enough off the default settings, I have to repeat the autotune when I power back up.

Except for the USR slots still being there, the symptoms seem like a bad backup battery. My amp is nearly seven years old, so I wouldn't be surprised if the battery needs to be changed. However, I'm not getting BATTERY LOW or CHECK BATTERY statuses.

Has anyone seen these symptoms?

2160. Power cycling the ACOM-1000 - follow up

Yahoo group: acom-list (1999 — 2009)
Date: 2007-11-20 17:37:32 UTC
From: Paul M Dunphy
Topic: 2160 Message: 2160

The response to the original question was 50/50 and I felt there was no really 100% right answer. I emailed Will at ACOM (K6ND) and his response was as follows:

"Hello Paul, I would let it just idle.

Regards,

Will"

That was what I had been doing anyhow. Putting the technical issues aside, as a DXer, I want to be prepared! I guess this one is a personal decision -- I have come to realise over the years that tubes (and light bulbs) usually blow when they are first turned on, not when they are sitting there doing their job. I would imagine 4CX800As do the same.

73/DX Paul VE1DX

Hello Bill,

Keeping the Acom 2000A on for the whole day will cost you a lot of kWh.

if the exciter power won't work them,
I'll try my TenTec Hercules... (400 watts)....

then I fire up the beast,,,,,,(in the basement)
http://albums.photo.epson.com/j/ViewPhoto?u=1771119&a=13683578&p=73801549

unless it's a day of radio (very rare).....then I'll leave the ACOM on.

bill

2164. anyway to stop beeping when I use 200 wattts in standby mode ?

Yahoo group: acom-list (1999 — 2009)
Date: 2007-11-21 02:05:04 UTC
From: va2nrj
Topic: 2083 Message: 2164

I really love my acom 2000A

I try to find a solution for this troubble:

I usually set my ICOM 7800 for 10 to 20 watts to excite the Acom 2000A
But when I don't want to use my amplifier, I just switch the amplifier in Stand by mode and ask the 7800 to have the full output (about 200 Watts)...Then the acom beep and beep and beep again telling me that I have to reduce my power...
Is there anyway to stop the beep and stay in stand by mode with 200 watts ? even in a hidden menu ?

I would like to add that during warming up the amp is not beeping EVEN with 200 Watts ..so I am sure there is a solution to tell the amplifier not taking care about power in stand by mode (exactly like it does during warming up)

Maybe in the next firmware upgrade ...

Maybe this message will be read by the acom's engineers...

Any answer will be appreciate ...

Hello Robin,

This came up once before. Because of the drive that the Acom has to handle on the stand by mode there is no way to stop this except turn off the amplifier completely. Search the reflector and you'll find reference to this.

Hello Robin,

Another suggestion is to back off just a little. Somewhere under 200 watts you'll be safe and lose the beep.

So let me try to ask you in other word : is it dangerous for any part
of the acom to use 200 watts in stand by mode...
If not why not unsoldering the buzzer..
I don't like to use this brutal force hardware solution but if 200
watts will never damage my acom why not ???

I can't answer that for you. There has to be a reason for the beeper and cutting the wire is not the solution. The beeper only gives you an indication about the circuit overload and power it can handle . Back off on the power going to the Acom for five or so watts and no one will notice at all. That's all I can add.

From: Bill NY9H
Topic: 2083 Message: 2169

when i first got my 7800 i was considering using a relay to force the 7800 down
(using a fake agc level) to 50 watts when using the acom.

But as it turns out, I usually leave the icom at about 50 watts, then switch in my solid state TenTec for 500, then going to the acom when needed AND PRE HEATED. I use a pair of top ten a/b switches to switch in the amps.

I think the ACOM manual says NO more than 200 watts THRU the amp...so joel's suggestion of backing off a bit should work. And if ACOM says less than 200 , I'll give that some safety margin.

Paul,
I thind the recommendation to leave it on or idle is the best choice. The concern has to be "does this shorten tube life?" It may, but I think that filament startup shock is more damaging. Also consider (before the days of solid state) the thousands of glass and ceramic tubes used in commercial transmitters in police and fire dispatch, repeaters and broadcast service. Those tubes were on 24/7, and replaced periodically. Those "pulls" often ended up in amateur service with barely any degradation. Some systems never change tubes during decades of service, and "on" the whole time. These "valves", of course, were the famed names like Eimac, RCA, and Amperex - hopefully the Svetlana's of today continue those reliability traditions.

Power cycling the ACOM-1000 - follow up
Posted by: "Paul M Dunphy" amplifier@... ve1dx
Tue Nov 20, 2007 9:37 am (PST)
The response to the original question was 50/50 and I felt there
was no really 100% right answer. I emailed Will at ACOM (K6ND) and
his response was as follows:

"Hello Paul, I would let it just idle.

Regards,

Will"

That was what I had been doing anyhow. Putting the technical
issues aside, as a DXer, I want to be prepared! I guess this one is
a personal decision -- I have come to realise over the years that
tubes (and light bulbs) usually blow when they are first turned on,
not when they are sitting there doing their job. I would imagine
4CX800As do the same.

Since there is not a confirmed answer to this question I have refrained from commenting but I do want to note that the Acom has protection from inrush current and an adequate warm up before the tube can be excited. I have done both over the years (about six or seven). Although I would prefer to have the amp always ready I think shutting down when you think you are done for the day may be better. I do remember seeing a post from Acom a few years ago that recommeded shut down.

2175. RE: [acom-list] anyway to stop beeping when I use 200 wattts in standby mode ?

Yahoo group: acom-list (1999 — 2009)
Date: 2007-11-21 23:18:46 UTC
From: Bill NY9H
Topic: 2083 Message: 2175

FROM a document from ACOM

ACOM 2000A Protection

Here is an information file about nominal and protection values of
some important quantities in ACOM2000A. Please note especially p.6
and p.11 about the heater LED and mains voltage:

1. DRIVE LED blinks above 80W; trips above 126W. Nominal value is
50...60W for rated output. Reduce drive to overcome the protection.

2(a). FWD-P and RFL-P trip above 203W during standby. Bypassing up to
200W forward and reflected power through the amplifier in STBY and
OFF mode is safe. A warning is issued in STBY at 203W threshold to
secure amplifier's bypass circuitry safety. With 200W-transceivers
you may overcome an eventual warning by reducing the power of about
5-10% or so, when the 203-watt threshold is exceeded accidentally.

Please note that switching off the amplifier does not resolve the
problem, as the amplifier only could not tell you that the power is
too high for it's bypassing relay, and a risk of a damage still
exists with more than 200W. If you need more power with the amplifier
off, you should reconnect the input and output cables leading to the
amplifier, in order to take it out of any transmitting path for more than 200W.

2176. RE: [acom-list] anyway to stop beeping when I use 200 wattts in standby mode ?

FROM a document from ACOM

ACOM 2000A Protection

Here is an information file about nominal and protection values of
some important quantities in ACOM2000A. Please note especially p.6
and p.11 about the heater LED and mains voltage:

1. DRIVE LED blinks above 80W; trips above 126W. Nominal value is
50...60W for rated output. Reduce drive to overcome the protection.

2(a). FWD-P and RFL-P trip above 203W during standby. Bypassing up to
200W forward and reflected power through the amplifier in STBY and
OFF mode is safe. A warning is issued in STBY at 203W threshold to
secure amplifier's bypass circuitry safety. With 200W-transceivers
you may overcome an eventual warning by reducing the power of about
5-10% or so, when the 203-watt threshold is exceeded accidentally.

Please note that switching off the amplifier does not resolve the
problem, as the amplifier only could not tell you that the power is
too high for it's bypassing relay, and a risk of a damage still
exists with more than 200W. If you need more power with the amplifier
off, you should reconnect the input and output cables leading to the
amplifier, in order to take it out of any transmitting path for more than 200W.

Hello all,

Can anyone provide me some info about serialnumbers for a Acom 2000A ?
This is about serialnumber : 040144
I want to know when this amp is build.
The softwareversion is 5.8 .

73,Hans,PA3HGT

Hans...

If, on the remote control head, you hit
ESC
HELP
and then scroll DOWN
you will find the build dates of your amp (also hours of run time, software revision code, tube numbers, and other helpful info).

It looks like your 040144 is a date code, ie 2004???

From: Richard Zalewski
Topic: 2180 Message: 2180

Is there an easy way to control the output levels from band to band?
I have to dit when making a band change and then have to adjust the
output drive of the Pro III on each band change.

2184. ACOM Mains PCB on 1010 Amp

Yahoo group: acom-list (1999 — 2009)
Date: 2007-12-03 03:26:08 UTC
From: Ron NØAT
Topic: 2184 Message: 2184

The mains voltage selector on the 1010 amplifier consists of jumpers you have to solder into a PCB inside the amplifier. It seems as though on every trip I take, I have to change the jumpers. On my last trip, to San Andres, the voltage had to be set to 210 volts, as they use 208 three phase.

After changing the jumpers a number times, the holes in the PCB have deteriorated badly. In fact the plating is all but gone out of one of the holes. There are traces on the bottom of the board, and it is almost impossible to solder to the bottom of the board. The board is difficult to remove as there are two TO-220 transistors soldered to the board and screwed to the bracket below.

Here is my question: Has anyone inserted terminals, or wired switches into the mains jumper positions? I decided something has to be done to keep from soldering and unsoldering wires into those holes. When I travel to contest expedition locations I don't always know what line voltage to expect, and I want to be able to easily change the mains voltage setting.

Why not solder 1 last set of wires to some sort of a connector hanging on a
pigtail of wires or
make up and Auxiliary PC board with screw terminals for future use

ACOM should have done that ...for the cost of the amp.....Geez !

John,

There's nothing special about using those two together.

You just connect the RF from the radio to the amp's input, and connect the PTT output from the radio to the PTT input on the amp.

Pages 76 and 94 in your manual discuss the amplifier connections for PTT on the Remote connector. Pin 2 is ground; pin 4 is PTT for the Acom 1000.

You'll want to reduce the power output on the TS2000 to drive the amp to within its comfort limits and/or legal limits. I have an Acom 2000, and the drive is around 40-50 watts. Much more than that and the amp is exceeding legal limit and is unhappy with the overdrive.

From: kamarty456
Topic: 2189 Message: 2189

Anyone using the NETCERTUS amp sequencer?
www.netsertus.com

I run the Acom 2000A and an Icom IC775dsp.
I occasionally experience the "Icom Power spike on transmit"
I usually am very careful and wait a moment before speaking..but you know the drill! Once and a while I will get a protect alert. I do use the ACC-1 configuration for the ptt of the amp.

I was looking at the netcertus unit as it is very small and adjustable. I believe the sweet spot for Acom is around 6msec.

I know some using the yaesu ft2000D and the Acom 2000A are also having a power spike issue and Yaesu seems uninterested in addressing it.
I also know the Icom 781 had a power spike on transmit. The IC775DSP had real issues in their first production runs and did address the problem. The newer production runs, mine was bought around March of 2000, do not exhibit a "serious" power spike on transmit. The Acom though is still sensitive to this anomaly.

My Acom was purchased in 2000. I'm not sure what software I have, but in the big picture the amp is flawless!

Too bad the folks at Acom do not provide some sort of sensitivity or other adjustment to compensate for the radio's problems. I also would have preferred if they allowed a 200w radio to pass through when in stand by...again a minor issue but some sort of user adjustment would have been very convenient.

I am still a very loyal user of the Acom 2000A and appreciate having it my radio station.

regards,

Marty ka7gkn

2190. Tubes life and replacement

Yahoo group: acom-list (1999 — 2009)
Date: 2007-12-04 04:44:24 UTC
From: Paul M Dunphy
Topic: 2189 Message: 2190

I realise that tube life is highly dependent on amp usage so I'm not asking *exactly* how long one should expect a 4CX800A to last. Just curious if many (any?) of the long term ACOM users on the list ever changed one? I have the procedure and I did a "dry run" (put the existing tube back in) a few weeks ago to see how complicated it is . . . not bad at all except you obviously have to be careful when adjusting the current pots for the replacement tube (i.e. in the presence of high voltage.)

Anyhow, I have an ACOM-1000 that is about 6 months old, goes every day, and works like a charm. Have a couple of NOS GU74Bs for replacements when the original goes, but am hoping it will be a long time. It was really impressive to take that thing apart and see the quality of workmanship. No wonder they are so popular and end up on DXpeditions in places where the temperature is -50 C and then 6 months later some other group takes them to a place where it is + 50 C. (Like Peter 1st and Swains Island.)

Anyhow, I am curious how many of you guys have had to replace tubes and how you found it to go. Looks to be to be about an hour's work with the 1000 . . . can't comment in the 2000 as I never saw a write-up of the procedure.

Marty,

I think that the initial spike problem is 100% a design flaw of the radio, so looking to the amp to resolve or to tolerate the spikes is putting the blame in the wrong place. The spike occurs no matter how high you have the power output set on the radio too. Your delay of speaking also makes no difference. I have seen this on many of the older Icoms. In contrast, the new Pro3 does not exhibit the problem. The Pro3 is an excellent radio in almost every respect. (If it had some crystal filters it would be perfect).

Regarding the use of 200w+ through the amp, it is strictly a safety limit for the amp. Since you cannot run that much power into the amp when it is operating, Acom has designed the amp to protect you from switching to operate by mistake at that power level and causing a problem with overdriving the amplifier.

If you need more than 100w or so just put the amp in operate mode!

That's why you bought it - no?

10 years of heavy use in nearly every major contest including 3 trips as airline baggage to Antigua, multiple operators making mistakes, SSB, CW and RTTY and still on the original tubes at full output. The vacuum relay recently started having some problems and was replaced.

I still rate the 2000A an A+.

Regarding the listing from KA7GKA, I expect in three days to receive the Netsertus board from South American. There's a lot going with their updated board and the manufacturer has been chatting with me regarding the "forward peak power spike" created by Yaesu. Because of the new Yaesu FT2000(D) is now out, I will "tell the entire story" on this reflector once the "board" is all working.

Remember, the problem may not just be the delay for my internal menu setting #145 but the "power peak".

Hope the above helps untill I'm ready.

Joel,

In reading the webpage information, http://netcertus.com (the earlier link was busted) it seems that this device is strictly an amp sequencer, which means that it prevents the transmitter from switching to transmit prior to the amp relay being fully closed.

What it does is this:

PTT input to netcertus board >
IMMEDIATE PTT to amp >
Delay some msec >
PTT to radio> (spike will occur here)

This is a good thing, but it will not prevent the initial spike coming out of a radio when it goes to transmit from getting to the amp.

The radio will put out the spike regardless of when the amplifier relay pulls in so I don't see where this device will help fix the design flaw in these radios.

Has your other communication with Netcertus that indicated that this device will somehow resolve this problem?

73,

Bob W5OV

There's a lot going with their updated board and the manufacturer has been chatting with me regarding the "forward peak power spike" created by Yaesu. Because of the new Yaesu FT2000(D) is now out, I will "tell the entire story" on this reflector once the "board" is all working.

Remember, the problem may not just be the delay for my internal menu setting #145 but the "power peak".

Hope the above helps untill I'm ready.

Subject: [acom-list] amp sequencer question

Anyone using the NETCERTUS amp sequencer?
www.netsertus.com

I run the Acom 2000A and an Icom IC775dsp.
I occasionally experience the "Icom Power spike on transmit"
I usually am very careful and wait a moment before speaking..but you know the drill! Once and a while I will get a protect alert. I do use the ACC-1 configuration for the ptt of the amp.

I was looking at the netcertus unit as it is very small and adjustable. I believe the sweet spot for Acom is around 6msec.

I know some using the yaesu ft2000D and the Acom 2000A are also having a power spike issue and Yaesu seems uninterested in addressing it.
I also know the Icom 781 had a power spike on transmit. The IC775DSP had real issues in their first production runs and did address the problem. The newer production runs, mine was bought around March of 2000, do not exhibit a "serious" power spike on transmit. The Acom though is still sensitive to this anomaly.

My Acom was purchased in 2000. I'm not sure what software I have, but in the big picture the amp is flawless!

Too bad the folks at Acom do not provide some sort of sensitivity or other adjustment to compensate for the radio's problems. I also would have preferred if they allowed a 200w radio to pass through when in stand by...again a minor issue but some sort of user adjustment would have been very convenient.

I am still a very loyal user of the Acom 2000A and appreciate having it my radio station.

regards,

Marty ka7gkn

I received four response in ten mimutes. Three direct and one on the reflector. I will hold off as I am running off now but the answer is the sequencer.

If you have a 781 or FT2000 look on a fast scope and you'll see the "rush spike" and this is regardless of your xmtr output setting.

PS....Spend a lot of time with Stan in Bulgaria but can't do it in pieces.

Thanks for understanding...

Subject: RE: [acom-list] amp sequencer question

Joel,

In reading the webpage information, http://netcertus.com (the earlier link was busted) it seems that this device is strictly an amp sequencer, which means that it prevents the transmitter from switching to transmit prior to the amp relay being fully closed.

What it does is this:

PTT input to netcertus board >
IMMEDIATE PTT to amp >
Delay some msec >
PTT to radio> (spike will occur here)

This is a good thing, but it will not prevent the initial spike coming out of a radio when it goes to transmit from getting to the amp.

The radio will put out the spike regardless of when the amplifier relay pulls in so I don't see where this device will help fix the design flaw in these radios.

Has your other communication with Netcertus that indicated that this device will somehow resolve this problem?

73,

Bob W5OV

Looking forward to Joel's info.

If what Bob said is so, I don't see that it's much different than using
the ACOM key-in and key out lines.
My understanding of how key-in/key-out lines work is as follows:

PTT sig to key-in, after TR relay in amp closes the key out line
generates the PTT sig for rig. That might be on the order of 10 ms later.

key-in/key-out only solves problems for rigs that don't have any
appreciable delay between PTT (or first dit for semi-breakin) activation
and RF output. It shouldn't do anything for the power spike problem.

Note: There are some reasons to be able to run 200 watts through the
amp. One is called 30M where the power limit is 200W
No waiting 90 seconds for amp warm up. The efficiency of the amps at
200W is poor. All that heat/power generated by the idle current is lost.

I believe I read in the Svetlana specs if not abused the tube can last 10,000 hours

If you respect the amp you should have a lifetime of use. If you run the amp 3 hours a day for 365 days you should see over 9 years of use!

Robert you are correct. This anomaly is strictly a design limitation of the specific radio and NOT the amplifier.
I discussed this issue in a manner simply to suggest such a "tough amp" could include tolerances for poorly designed radios.

I truly do not put the monkey on Acom's back to fix other products issues.

Please read this in the positive manner it was written.

Thank you

2200. Another 4CX800A/GU74B question

Yahoo group: acom-list (1999 — 2009)
Date: 2007-12-04 17:50:37 UTC
From: Paul M Dunphy
Topic: 2200 Message: 2200

This was asked to me off line, but it's something I too have been wondering. Given that no one here seems to have ever had to change the tube(s) in the 1000 or 2000 amps, it may be hard to answer. The ACOM procedure doesn't mention anything about degassing or conditioning replacement tubes other than letting them sit for 15 minutes powered up before idling current adjustment. Any tubes we are likely to acquire will likely be years old, probably NOS GU74Bs. Does anyone have any thoughts on how to bring these up to working strength?

My first guess would be to put them in the amp as per ACOM's instructions and let them sit 3-4 hours instead of 15 minutes before adjusting the idling current - which requires the application of a bit of RF drive. Is there anything else one can or should do?

My sense is that since 4CX800A/GU74Bs were designed for military service and the expectation was they would be changed under harsh conditions in a hurry, they are one tough tube. I don't think they need the TLC of things like 8877s, etc. However, if it has been sitting on a shelf for up to 20 years, perhaps it needs some conditioning and one shouldn't just pop it in the amp and use it. Any tube experts here?

Dear OM Paul,

Abt the GU74B tubes. I asked Stan (Acom) if there is a procedure to re-activate the tubes.

See below the e-mail from Stan:

Stanimir Lekov (acom@...)

To:

Kees - pa7two (pa7two@...)

Subject:

Re: Question about Acom 1000 for Stan

Attachments:

TubRep1000.txt (8.9 KB), GU74B_Base.jpg (68.1 KB)

Hello Kees,

As a minimum, you should check the tubes outside the amplifier. It is not wise risking amplifier mechanisms to only check a suspicious tube.

As a minimum, you can apply heater voltage and some air cooling for 4-5 hours, before trying to insert the tubes in the amplifier. You may use a 12.6V/4A AC or DC source for heater and a household fan blowing directly the tube for this purpose. The start current can reach 10-12A and the nominal value is 3.6A.

Then check that no internal short circuits are present between all tube electrodes (look at the attached picture). Check this with hot and with cool cathode. When the cathode is hot, observe proper polarity (flowing some current is likely with positive grids to cathode). While checking with cold cathode, you may use up to 100V between cathode and heater, as well as between cathode and G1. You may use up to 500V between G2 and any other electrode and up to 1000V to the anode. A standard mega-Ohm meter would be suitable for this purpose. With hot cathode and using a 500/1000V standard mega-Ohm meter, you may apply high voltage to the anode provided you have connected the two grids to the cathode.

You should be very careful when replacing the tube in the amplifier. First of all, keep off the HIGH VOLTAGE! And then be careful not to squeeze any socket spring contact. Please find attached the

replacement instruction.

If you have more questions please feel free to contact ACOM again.

73 Stan LZ1IU
Sofia, 26 October 2006.

Hello again Kees,

If the tube has been on the shell for less than five years, you may follow a shorter procedure. It would be of use to first check the tube with an Ohm-meter before installing it anyway.

When you turn on the amplifier, wait for 30-60 minutes in STBY mode (the newer the tube the shorter the time required). The screen-grid voltage is off in STBY mode. You may check for plate current presence during this period (the current should be zero).

It is important not to press the OPER button earlier. Then go to OPER mode and adjust the idling current as described in the Tube Replacement instruction. Finally do several QSOs with about half power and that's enough for preparation. You may use the full power and see how good is the tube.

2206. 2000A serial port

Yahoo group: acom-list (1999 — 2009)
Date: 2007-12-06 13:24:01 UTC
From: N1EU
Topic: 2206 Message: 2206

Can anyone verify that it's okay to use a "y" connection to connect
the 2000A serial port to both a PC and to the 2000SW antenna switch?
Way back when Acom Tools was an item, I believe the "y" connection was
being used by some.

Thanks/73,
Barry N1EU

2207. Acom amps and tubes

Yahoo group: acom-list (1999 — 2009)

I have been reading with concern the comments regarding the tubes for these amps going out of production. Today I contacted the UK distributor and below is the reply I recieved, makes interesting reading;

From: Ron
To: Mark M0MRR
Sent: Friday, December 07, 2007 3:22 PM
Subject: Re: acom amp

Hello Mark

Some idiot has done plenty of damage by putting out the rumour that the 4XC800A is no longer in production. The website of the manufacturer, Svetlana Tubes, lists them as a current product, and we have no trouble whatever in getting supplies. We have plenty of spares here for the foreseeable future, by the way.

No doubt one of the "experts" that are around has decided he knows best and started off a stupid rumour. I should be most interested in who the instigator of this nonsense is so that I can send him my personal thanks for the considerable time I have wasted on replying to enquiries about it.

Should Svetlana cease production of this extremely popular and rugged vacuum tube, and I see no reason at all why they would do that, then there are many thousands in stock in surplus equipment stores all over Eastern Europe.

Please feel free to publish this email on the discussion group where this silly rumour started. I expect the particular goon behind it is rubbing his silly knees with joy, having caused quite a few people needless concern. Whoever it is, I suggest he gets off his stupid computer and gets on the air where, just conceivably, he might cause less harm.

In any case please let me know where you have seen this so that I can put peoples minds at rest about it.

<snip>

I don't think anyone started any such rumour, or that one saying
the tube is no longer in production is going around is true.

What is true is that the cost of 4CX800A/GU74B tubes has
increased dramatically in the past couple of years. These tubes were
available for around $100 USD several years ago. The supply of NOS
tubes is drying up (people are recommending eBay as a source!), and
for example, RF Parts in California was charging ~$350 6-8 months
ago, and the price in now listed as "call." My experience is that
"call" = expensive.

I believe the concern is twofold:

(1) The cost of new tubes is somewhere in the order of $400 USD

(2) Some NOS GU74B tunes are still available for less (~$150-200) but
given that they may be 15-20 years old, ACOM is recommending they be
conditioned outside the amplifier for many hours by first heating the
filament, and then slowly ramping up the plate voltage. As I recall,
this is a 24-36 hour process and the plate voltage is high - 2600
volts. This is fine, but requires equipment and expertise many Hams
do not have. (2600 volts is not to be fooled with unless you know
your stuff.) It would be a lot nicer if we were assured we could
just switch a bad tube with a replacement *in the amp.*

That said, I am very happy with the ACOM-1000, have not been able to find anyone who has ever had to replace the original tube (or tubes in the case of the ACOM-2000.) I would highly recommend either amp to anyone.

I believe Ron is over-reacting. Certainly replacement tubes are available. They are just not as inexpensive as they were several years ago. The cheaper alternative GU74Bs require expertise and time to replace.

Topic: 2209 Message: 2209

I've had my 1010 for over two years now and it is such a user-friendly amp that I leave it plugged in at home even though I originally bought it just for travel.

Anyway, just recently I was tuning up on 80M and saw a lot of arcing inside the case. I took the covers off and it turns out that, with time and transport, a disk capacitor was "drooping" and touching the ground side of the tuning variable.

There is a small PCB with five capacitors connected to the band switch, right above the tuning variable. The lowest one is larger and when bent all the way down can easily touch the variable.

I don't think there's any harm done - I cleaned up the soot, covered the burned disk capacitor with tape and all seems to work fine. However, just to be sure I'd like to replace the burned part...

Does anyone know how to find an Acom 1010 Circuit Diagram / Parts List? The "Files" section only has these for the other amps in the product line...

Many thanks, folks, for the help with the files!

I've also spoken with Stan in Bulgaria who is sending me the latest CD
with information.

You might also like to know that Acom have introduced a mechanical
modification that supports this capacitor with a small plastic tab to
keep it off the variable. If anyone has the same issue with a
"drooping" 80M/160M load padding capacitor that touches the load
variable, it might be worth installing this tab.

The Voltage is too low or too high. When the Voltage is too low the led indicator blinks slow and when the Voltage is too high the led indicator blinks fast (twice per second).

The nominal heater Voltage (Filament Voltage) must be around 12,6 Volt.

Have a look at the A2000A_Protections.txt file, p. 6.

What is the your Mains Voltage? E.g. 220, 225 or 230 Volt?

Also if you have an older unit, the filament connector tends to burn up
from excess heat and later on ACOM used
a different connector which they can supply you with or
you can do as I did and soldered the leads directly to the PC Board

2216. RE: [acom-list] acom 2000 A Heater light indcators flickers

Yahoo group: acom-list (1999 — 2009)
Date: 2007-12-19 10:30:52 UTC
From: Maximo EA1DDO/HK1DX
Topic: 2213 Message: 2216

Hi,
From the Acom 2000A Protection document;

6. Concerning the "HEATER" LED
indicator you may need the following information:

If "HEATER" indicator lights
continuously, probably mains voltage is lower than the nominal. If it often
blinks (twice per second), mains voltage is higher. You may still work safely
even when "HEATER" is lit, as this is a warning indication only, but
the protection threshold is yet close. If even more severe mains voltage
deviation occurs, the auto protection would trip, the red "PROT" LED
will flash, and an appropriate text message will be issued on the LCD.

In order to determine how close are the
trip conditions, you may enter the MEASURE sub-menu and monitor the following
values:

- MAINS (line input voltage, no protection
is directly derived);

- FIL-V (filament voltage, 10V to 14.4V is
acceptable);

- IF-REAR (filament current - rear tube, 3A
to 4.4A is acceptable);

- IF-FRONT (filament current - front tube,
3A to 4.4A is acceptable);

The heater voltage protection would trip at
voltages below 10V or over 14.4V, and the corresponding message to the operator
is issued on the RCU. Respectively, the thresholds for heater current
protection are 3A and 4.4A, and appropriate messages appear when tripped.

For your information, the nominal filament
voltage is 12.6V, and the nominal current is 3.6A. The "HEATER"
indicator on the RCU is normally dark. It will light constantly if the filament
voltage drops below 11.6V, and it will frequently blink if the voltage exceeds
13.6V (in order to inform you that nearly half of the acceptable range is
crossed). In both cases the voltage selection may need to be changed if this
conditions predominate. See also p.11 below.
73, Maximo - EA1DDO.

From: George Steube
Topic: 2213 Message: 2217

I notice mine doing the same thing last weekend. It only lasted for a couple of seconds and has not returned. According to an ACOM acceptable parameters list this is only an indication that an operating parameter has drifted out off nominal range. It is a warning that the protection circuit limits are closer to operating. The things that cause this indication include: high mains voltage, high filament voltage, and high filament current. I think low mains voltage may trigger this warning, but I would have to check. When I noticed this issue I started to monitor all of the parameters mentioned above. I am using TRX manage so I could monitor four of them at the same time and saw the mains voltage was a little on the high side at 252V which in turn raised the filament voltage to 13.3V. Note that none of these values is even close to the trip levels of the protection circuit. The ACOM parameters list stresses that this is not a problem and does not negatively affect the amp. This time of year the power companies may be running with higher line voltages because the summer A/C loads are not there. They will adjust their voltages seasonally and this may be part of the problem. Couple of days after the heater light flickered the line voltage was down to 249V.

My Acoms' mains are set for 240 here, I get a fast blink on my heater indicators 3 or 4 times a years - usually lasts a day or so. Called the power company here in GA, USA, their requirement is 240 +/- 10%, which means they can supply 264 VAC. I have seen it as high as 253. At 253 the heater LEDs are blinking - not much I can do about it. In fours years this has caused no damage - as infrequent as it is.

It will not harm the tubes when the heater Voltage is between 12.6 and
14.4 Volt.
But, it can harm the tubes when the heater Voltage is between 12.6 and
10 Volt.

For this reason it is better when you Mains is somewhat higher than lower.

Most of the time our Mains is around 227 Volt. Therefore I use the 220
Volt transformertaps instead of 240 Volt. With those taps the Filament
Voltage of my 2000A is about 13.3 Volt.
When I use the 240 Volt taps the Filament Voltage is about 12 Volt,
which is too low.

Unfortunately the Acom 2000A does not have 230 Volt transformertaps.

My 2000A is giving me periodically a low bias indication then it shuts down.
Most of the time the bias is -122V. But once in a while sitting idle I will
get something like "bias too low". The value could be -38, or 00V. Any
ideas where to look for this problem as it is not consistent?
When I don't get this indication I still seem to be putting out full power.
Run time is 6070 hours.

Tnx
N2TK, Tony

Tony, the fact that the problem isn't consistent is going to make it a bit more difficult to troubleshoot. It sounds like either the bias voltage regulator or a bad tube. If you have a good spare set of tubes, I'd install them and see if the problem completely disappears. That's probably going to be the fastest, best shot at identifying the problem.

You should also email Stan at Acom and he can provide a thorough troubleshooting methodology. The first step is probably taking a number of bias voltage measurements when the amp is in the failed state.

This is likely a bad tube. Try this: With the amp is 'standby' monitor the bias voltage. Is it nice and steady - even over a period of hours? Then monitor 'bias' with the amp in 'operate' but not being operated. Does the voltage wander around and occasionally trip the amp for low bias voltage?

Replacing a tube solved this problem for me a few months back. I kept the old tube as a "last resort" fallback tube. It would put out full power and worded FB in every way - except for tripping the amp for low bias once ever few operating hours.

Hi Hal,
Tnx for the input.

I can have the amp in standby all day and sometimes I leave it on for days and everything is fine. The bias will stay rock steady at -122V. I can operate with no problems. Then all of a sudden the amp shuts down and I get the low bias alarm.

I have a spare set of new tubes. Pain to get the amp down to work on it. It is on a shelf in the basement close to the ceiling. I have the RCU on the main floor in the shack. B But it looks like it is time to change them.

To conserve tubes, I would replace them one at a time, to figure out which tube it is. You may want to install a new set once you have that figured out, but you will have a "good" pull and a "bad" pull at that point. The good pull is worth having as a spare.

If you are cheap like me - you can replace just the bad one. I've been running now with a new tube and a tube with something like 2000 hours on it. They match well in temp and work fine. One would expect the tube with more hours to go bad first, looking forward from here - but you never really know.

I put in a set of NOS tubes. During the timer count down I got a "low bias 00V" and it shut down. So, maybe it is the bias supply?
I was going to take out both tubes and fire it up that way. Is there any reason for not powering it up with no tubes to see if the bias voltage is okay? If so, I will try that.

If the bias looks okay with no tubes, then I suppose I can try one tube at a time. If I put in one tube at a time do I have to worry about not enough air getting to the tube since there won't be an air restriction with the open socket?

If the bias voltage is still zero without any tubes I will focus on the bias supply.

So far haven't heard back from Stan.

Tony, I sent you separately some troubleshooting info I received from Stan
for the "Bias too low at power on" error.

If you've only tried bringing the amp up once with the new tubes, I'd
definitely try again a few times.

Jim's suggestion of calling Acom USA directly is a good one, but I've
personally had consistently quick response from emailing Stan.

Hello Marty,

Thanks for your wise advise!

Yesterday I cleaned the filter with hot water and soap. It was not very dirty after 450 hours operating time, but on my 2000A I don't have the extra fan installed.

Tnx for all the advice. The problem turned out to be a shorted tube. I had purchased a pair of NOS tubes from eBay. One of those turned out to have a short too. As it seems all of these NOS tubes are sold "as-is" I am stuck with the one tube. At least the amp is now cooking with one tube with 6K hours and a supposedly NOS tube. I will leave it run without any drive the rest of today, just in case before I put it back together and put it up on the shelf.

Even QRO.parts.com will only sell them "as-is". So, any ideas where I can buy a pair of GU-74B/4CX800A tubes?
Supposedly Svetlana is still making this tube, but who knows where they are going?

I would like to know how to proceed with a NOS tube in a ACOM 1000
amplifier as well. Who knows the answer for the easiest way to getter
a tube in this amplifier?

2241. Acom 1000 input power dissipation..

Yahoo group: acom-list (1999 — 2009)
Date: 2008-01-20 22:09:31 UTC
From: gw0etf
Topic: 2241 Message: 2241

Just wondering how much power the input circuit (50 ohm 'swamping' resistor etc) should be dissipating.

If for instance I apply 50 watts from the tx, the Acom's drive power registers about 40 watts (so presumably metering is after the input circuits...). The stated gain of about 12.5 dB fits the input power measured by the Acom but is low when referenced at the output of the transmitter.

Does all this sound reasonable...?

73,

Stewart Rolfe, GW0ETF

From: Hal Kennedy
Topic: 2241 Message: 2242

The absolute maximum control grid dissipation for the amp's tubes is 2 watts per tube. In proper operation a tetrode will dissipate virtually none of the drive power. The drive causes a controlling voltage within the tube, but the grid itself draws virtually no current and dissipates virtually no power. Here is a great little experiment for anyone who likes to run their ACOM 2000As with a lot of the red lights lit on the output power bar (assuming a 50 ohm load): Run the amp through an auto tune, then monitor the grid current while slowly turning the drive up. Notice the grid current is 2 mA or less - until you get a little past the design point - which is 1500W output - beyond which the grid current starts raising rapidly. Want grid shorts in your tubes? - run with those red lights on all the time. Notice also, the screen current also takes off above 1500W out. It's a 1500W amplifier, not a 2000W amplifier. There is a reason the green lights are green and the other lights are not green...

The input swamping resistor - which is 50 ohms because the grids it is in parallel with present nearly no impedance at all (some capacitance) - dissipates all but maybe 1 watt of the drive power. The metering is on the input. Stewart, If the amp says its getting 40 watts of drive, it is. If your transceiver says its putting out 50 watts - either you have a poor coax between them, or perhaps a bandpass filter or something else introducing loss between them, or the metering in the radio is off. On one of my two FT-1000MPs here the meter reads substantially too high - the other reads correctly. Check with a known good meter - a Bird perhaps - you will see the ACOM is correctly indicating what it's receiving in the way of drive power - and all of it is being dumped into that 50 ohm load resistor.

Have you tried going to the Acom Groups home at
http://groups.yahoo.com/group/acom-list/messages and searching on
"bias too low at power on"?

There have been several threads on this problem.

This is all fine in theory.

We need a procedure we can use with our ACOM-1000 or ACOM-2000 boxes.

I doubt we can put a variac on the AC line and get anything but trips.
The best we might be able to do is set the jumpers for the highest line
voltage which may or may not reduce voltages significantly.

The query for such a procedure is now years old.

All that has been provided is what not to do.

I can't seem to dig it up, but I seem to remember info posted a while back indicating you didn't need to go through the full blown gettering process but instead could run the NOS tube in the Acom for several hours with no drive. Does anybody remember that info better than I do perhaps and can point to the source?

The reality is all we can do is put the NOS replacement in, plug our ears so the BANG won't scare the crap out of us and turn it on. Pray that if the NOS tube is shorted it doesn't damage the components of the amp when it blows or arcs.

If it fires up, just let it sit w/o RF drive of 5-6 hours, and I think it will be OK. The average Ham doesn't have all of the equipment recommended to condition tubes that have been sitting around for years, and at the cost of the ACOM-1000 and ACOM-2000 amps, we shouldn't have to. Whenever my original tube goes, that is what I plan on doing, anyhow. There really are not a lot of other options.

I asked before if anyone had ever changed a tube(s) and I seem to recall two classes of answers (1) No, never or yes and no problems and (2) had to send it back to the factory. I'm crossing my fingers that (1) is a lot more common than (2.)

Hi all,

I think it is indeed good practice, like explained on the website link, to heat up the fillament (voltage raised in steps over some hours). I only wonder if I should short the other remaning pins of the tube to earth (-) or not?

To my knowledge there is no "official" or "approved" gettering procedure for bringing up a NOS tube within the amp (1000 or 2000A).

I have changed-in many sets of NOS tubes into my 2000As without any problems at all, and I do what I believe is similar or the same as what is done at ACOM:

Fully install the tubes and turn on the amp. Let it sit in standby for 5-6 hours. Then go to operate and run the amp in intermittent service (a nice CW rag-chew) at half output power for 30 minutes, and that's it for gettering. To complete the job - run the tube replacement bias adjustments per the amp's tech manual.

The common failure in a tube with some gas is an anode arc-over. However, since the DC anode voltage in these amps is substantially lower than the maximum allowed for the tube, and in standby the control grid is biased WAY off, and the screen voltage is zero, the chances of an anode arc are negligible. The tube would have to be total junk to arc under these conditions. I would be interested in hearing from anyone who has ever had an anode arc-over bringing up a NOS GU-74b in an ACOM amp. This is not to be confused with so-called NOS tubes (particularly out of the Ukraine) that demonstrate grid shorts right out of the box - these are simply tubes that were used or dropped to destruction before you got them.

A not unrealistic alternative is to buy a used (or NOS) socket on eBay, and with some air blowing up through the socket simply power the filament of the tube in question at full filament voltage for a few hours. You cannot simply clip-lead on to the filament pins and power the filament. Without the socket and cooling air the filament seals will be destroyed in short order.

Hi OM Hal,

Good procedure you described, thanks

Realistic scenario: One buys a NOS tube on eBay or local radio market. First step is to check the tube pins on shorts after arrival. Never ever forget this first step...

Rearding the fillament / tube cooking, with increase of voltage in steps to the max allowed for some hours, with a fan pointed to the tube should be possible I suppose?

BTW: Had some bad gu74b tubes via eBay which I payed via PayPal. After step 1 (see above) wrote seller a letter and filled in complain form about the broken product, in all 3 cases got full refund after one month waiting. Use PayPal, it forces sellers to ship tubes / stuff that works! Otherwise money back1

Is it worth the potential headaches to try to save $100 on tubes for a
$5K+ amp?

Some of you guys must be driving the heck out of your amps. My first
Acom 2000A (recently sold) was almost 10 years old and still had full
output and no issues. My second 2000A, 6-7 years old now and still in
use, still 100% as well.

Barry,

I don't think the issue is that we are trying to save $100. I'd pay $400-500 for a new tube if I could find one. The reality is the supply of 4CX800As dried up. We are forced to get NOS tubes wherever we can. The GU74B is a drop in replacement, but those available are 10-15 years old or more. Like you, I never had a problem and I have a few spare NOS tubes if I ever do. I'd just like to have the assurance that if my original tube does go, be it next month or 8-10 years from now, I can put a replacement in it without fooling around with Variacs, fans and spare chimneys/sockets outside of the amp for several days before I dare put it in.

That's the issue . . . not that we are pushing these things to 110% of their rated capacity, but rather what do we do when a tube goes? (and they all will, sooner or later, even yours)

Hi Barry,

Your assumpition was incorrect, at least I am talking about a spare tube... I have no clue why you thought that my original tube was broken?

These days the tubes are still affordable, although looking at prices on eBay the prices are raising RAPITLY over de last year.

Is it worth the potential headaches to try to save $100 on tubes for a

$5K+ amp?

Some of you guys must be driving the heck out of your amps. My first

Acom 2000A (recently sold) was almost 10 years old and still had full

output and no issues. My second 2000A, 6-7 years old now and still in

use, still 100% as well.

As Paul and others have said Barry - it's not a question of the money or of driving the amps hard (at least in my case). I have no source for new tubes and I don't believe they are being made at this time. There was an irate post a while back from an EU ham who said new 4CX800As were readily available from Svetlana and he was a distributor. I immediately sent him an email for a quote for 100 new tubes - that was and still is a serious inquiry. He never replied. If ANYBODY can connect me to a source for 100 new 4CX800As in sealed Svetlana boxes with date codes of 2005 or better - please email me immediately. Has anybody ever seen a 4CX800A with a date code of 2005 or newer? There is a reason Alpha, ACOM and Ten Tec ship amps with "new" tubes that have date codes in the 1980s and early 1990s. As to life, the Svetlana spec sheet for the GU-74b says: ">1500 hours." I spoke at length to Tom of Tom's Tubes about life before Tom went SK. Based on his experiences his number was "2500-3000 hours average." One the 2000As here has 4000 hours on it and runs perfectly on its original tubes. The other 2000A here has 5500 hours on it and is on its third set - although the second set were known "junk bench-test tubes" that I got as a favor from one of the amp manufacturer's service departments. I had an Alpha 99 that probably had 5000 hours on it when I sold it - it was running great on its original tubes. Most of the tube changing here has been to test NOS spares I am collecting as the NOS gets depleted and prices continue to climb - and since I can't find new ones. If someone will sell me 100 or more new ones I plan to make them available as a service and at negligible profit - don't hold your breath. As an aside, I would prefer a NOS GU-74b from 1985 to a brand new 4CX800A assuming the NOS tube really was new. The Soviet tube was mil-spec and well made. The Russian 4CX800As that do exist have had shorter lives and a greater tendency to grid shorts based on my limited experience.

Great tip on PayPal Kees - thanks! Good luck to us all on tubes. Maybe Svetlana (or someone else?) will restart production at some point. I'd be very interested in a Chinese 4CX800A - but the Chinese don't seem to have progressed past all-glass tubes... yet.

Hi OM Hal,

I am not aware of a difference between Russian and Soviet GU74B tubes? I have only seen the GU74B and the 4CX800a marks on the tubes.
GU74B marking on the old Svetlana brand with a dull looking tube; and 4CX800a on the SED (current brand) tubes (Svetlana Electronic Devices) which are nice & shiny like the EIMACs .
I am told that the new tubes are still produced by SED, but only for militairy purposes.

>and 4CX800a on the SED (current brand) tubes (Svetlana Electronic
>Devices) which are nice & shiny like the EIMACs .
>I am told that the new tubes are still produced by SED, but only for
>militairy purposes.
>
>Vy 73, de Kees

I did a bit of detective work (Internet searching) and found the
following:

"Svetlana tubes were originally manufactured by a company called
Svetlana Electronic Devices. At some point, New Sensor Corp (who owns
Sovtek) bought the rights to the name "Svetlana". Tubes made now that
are marked as "Svetlana" tubes are made by Sovtek. However, the
original company is still making the same high quality tubes they
always had been. They are now being labelled "SED" (Svetlana
Electronic Devices)."

I then found New Sensor Corp's web site:

http://www.newsensor.com/

They have a New York address and list Svetlana as one of the
product lines they carry, however, under their Svetlana listing,
there is no reference to a 4CX800A.

If you search on Sovtek, you get a lot of hits of resellers who
offer many audio (glass) amplifier tubes, but never a reference to a
4CX800A of any other metal/ceramic tube. Sovtek's web site in Russia
talks about restructuring and real estate:

http://www.sovtek.ru/gruppa_e.html

I don't know if anyone makes NEW 4CX800A anymore. It's possible
you are correct that some are made for military purposes, but I can't
find any reference to it.

About a year ago a talked to RF Parts. They were offering
"Svetlana" 4CX800A tubes for around $350. The person I spoke with
said they has a source in Russia, and that these tubes were (a) not
new and (b) they (RF Parts) had no way to test them but that they

would refund faulty ones on a "case by case basis" if it was obvious they were faulty when received. He also said they were getting harder and harder to get (the NOS Svetlana ones they were selling.) He described them as looking shiny like EIMAC tubes and not having the dull look of the GU74Bs. His advice to me was "better get one or two now because I don't know what they will cost in a year or two, or even if we will be able to get them."

So . . . over the past year I have acquired 4 NOS tubes. 2 Svetlana 4CX800As and 2 "in a sealed box" GU74B tubes. They were not cheap and they didn't come from eBay. Both sources have none left and I am *not* selling mine. I presume they will work when I need them. If not, I don't know where I would look. This still leaves owners of ACOM, Alpha and HF-2500DX linears in a bit of a bind.

QRO says on their web site: "F YOU USE TUBES OTHER THAN THE ONES DELIVERED WITH YOUR AMPLIFIER, QRO TECHNOLOGIES IS NOT RESPONSIBLE FOR ANY DAMAGE CAUSED BY THOSE TUBES. YOUR WARRANTY WILL BE VOID AS IT RELATES TO ANY DAMAGE CAUSED BY THOSE TUBES. YOU WILL BE RESPONSIBLE FOR THE REPAIR COSTS AND RETURN SHIPPING.

THE 4CX800A (GU74b) TUBE MUST BE PROPERLY GETTERED (DEGASSED) AND TESTED BEFORE USE. THE TUBES SUPPLIED WITH OUR AMPLIFIER HAVE BEEN GETTERED AND TESTED. TUBES SUPPLIED BY OTHER VENDORS HAVE NOT BEEN PROPERLY GETTERED AND TESTED. THESE TUBES HAVE A STRONG TENDENCY TO ARC CAUSING DAMAGE TO THE AMPLIFIER. WE STRONGLY URGE YOU TO MAKE SURE ANOTHER TUBE SUPPLIER GETTERS AND TESTS THE TUBES HE SELLS AND GUARANTEES THOSE TUBES."

I guess that pretty much sums it up. We have great amps, but tube replacement is going to be costly, if available at all, in a few years.

73/DX Paul VE1DX

2261. GU-74B tubes

Yahoo group: acom-list (1999 — 2009)
Date: 2008-01-23 15:56:23 UTC
From: N2TK
Topic: 2261 Message: 2261

Well, I tried to buy a pair from QRO-parts. Because they are selling the tubes "as-is" with no warranty they will not accept Paypal or a credit card like they do for other tubes. They will only accept a money order. Before I send off a money order, has anyone bought GU-74B tubes from QRO-parts? If so, any issues?
I see there are some tubes from the Ukraine available on eBay. I thought I remember some issues with the Ukraine tubes or was this just a bad rumor? Looks like they have the Svetlana emblem on them.

Any word on what Acom is doing for tubes these days? If this has been addressed recently, my apologies as I am way behind with email. Hope to catch up this week.

Tnx for any feedback.

Hello All,

I am wondering if there is someone out there that can do the "Gettering
and testing"
of these tubes for for a reasonable fee???
It seems that most of us do not have the equipment to do it properly.

I have 4 GU74B spares for my 2000A. I will need to use them some day..

Thanks for any info.

A good idea Ted. I'm sure there are a few here (or elsewhere)
who have the equipment and expertise to do it. The only downside is,
what if your send them your tube and it goes BANG when they flash it
up? Who's fault was it? Was it shot to begin with? Did it get
damaged in transit? Or did they make a mistake? If I had the
equipment and expertise to do it properly, I'd do my own, and maybe
that of someone I knew very well for free. As soon as you take money
and a tube from someone else that is just a call sign, you are
accepting responsibility for the tube.

I think that's why we haven't been getting a lot of sympathy
here because those who have the gear and knowledge of how to do this
are not going to speak up. As soon as they do, they will get a dozen
emails asking "can you do mine?"

Maybe a better idea would be to pay ACOM (Will and/or Krassy) to
do it. Maybe if we send them our tube(s) and $50-100 they will
condition them for us. That would be better than sending the whole
amp back. I *know* I can change the tube in an hour or less if it's
a good one. They (ACOM USA) must have the capability to get the tube
ready, because the manual says we shouldn't be changing them
ourselves to begin with.

I don't see Acom having any interest in doing this. Their interest should be in selling you fully tested tubes. They normally do this, but I checked recently and they were out of stock with no idea when they would have more tubes.

With the tubes unavailable from Acom, my approach is to buy the tubes and warm them up myself in the amp, per Hal's recent post.

Yes, I got two (unpaired) GU-74B from QRO-Parts and kept the community informed about.
Payment went easy via "Moneybookers.com" and response from both of them, QRO-parts and Moneybookers was just in time.
Ok, I have the tubes as spare parts, so no info about gettering, arcs, ... yet.

Betreff: [acom-list] GU-74B tubes

Well, I tried to buy a pair from QRO-parts. Because they are selling the tubes "as-is" with no warranty they will not accept Paypal or a credit card like they do for other tubes. They will only accept a money order. Before I send off a money order, has anyone bought GU-74B tubes from QRO-parts? If so, any issues?
I see there are some tubes from the Ukraine available on eBay. I thought I remember some issues with the Ukraine tubes or was this just a bad rumor? Looks like they have the Svetlana emblem on them.

Any word on what Acom is doing for tubes these days? If this has been addressed recently, my apologies as I am way behind with email. Hope to catch up this week.

Tnx for any feedback.

I can't find any GU-74B tubes listed on their web site:

http://qro-parts.com/

Lots of other NOS tubes, including many from Svetlana, but no
GU-74Bs are listed. The closest they have is a tube socket for one . . .

Seems like the supply has dried up. Too bad, because ACOM and
other manufacturers have made this tube the workhorse of their
flagship amps. Hopefully the demand will increase to the point where
someone will start making NEW 4CX800As again. I guess the lack of
NOS tubes means gettering and degassing them won't be a problem anymore.

What I'm told about tubes from the Ukraine is they are mostly pulls from scrapped Soviet era gear. As such, they are used, not NOS, and of unknown quality. Best I can tell, the GU-74Bs NOS tubes that come from the St. Petersburg area are in fact, at least for the most part, out of warehouses that the Soviets filled in the 1980s and early 1990s. You remember the Soviet system of production..make ten years worth of toilet paper for a year, then shut down the line and make ten years worth of GU-74Bs for a year, then shut down the line and..etc. So, you wind up with warehouses full of GU-74Bs and no new production. It wasn't a very good system, hi, hi.

There is a real opportunity for Eimac or someone to pick this up and run with it, as the tube will become increasingly in demand. I think Ill call Eimac and try and peak their interest. Ill report back what I hear.

Just wondering.
Are solid state amp "finals" going to be just a problematic a few years after the amp's sale?

Like buying tools or household mops. Buy a ton of replacements for expendable parts when you buy the tool. You'll never find them a year or so later

Hi Hal,

At least a very cost effective production method for sure :-). Still on eBay many GU74B tubes are put on for sale, so buy some if one can afford one.

BTW: To me, if a tube is a pulled tube from ex millitair equipment, and this equipment was not or barely not used, the tube was heated during test cycles and not more. I would name that a perfect tube as a spare?

Does that mean there are 11 left in the world? I would feel more
comfortable with 100's or 1000's.

This thread kind of reminds me of the "toilet paper shortage crisis" of
years ago. Some late night talk show host put out the rumor that there
was going to be a shortage. The next day throngs of old ladies filled
up their shopping carts with hundreds of rolls of toilet paper and
precipitated a shortage.

I was going to add that this reminds me of the sweep tube shortage for Drakes a few years ago and the 811A shortage for the 30L1.. Gee, I never had a problem finding any. In fact I have so many spares kicking around (since I fell for it too) that it's almost ridiculous. Including a large box of NOS JAN 811A's I got for free since they were going to the dump.

This stuff is all around.

Check out what I read in the just released User_Manual of the Alpin 100 MKII amplifier:

Before assembling the new tube it must be ?conditioned?.

Connect Pin 3 and Pin 7 to a power supply with 12V DC and adjustable current limiter.

Supply each of the following currents for 3 minutes:

0,5 A / 1 A / 2 A / 3 A / max current ca. 4 A .

The procedure should be finished after 15 minutes to prevent heat problemsVy 73, de Kees - pa7two - m5two

I agree and this is not a case of fear mongering or starting rumours to get everyone worried. Someone used the analogy of 811As. Where do you get 811As today? From RF Parts, who get *all* of them from China, and they have a half-life of a month, at least in an AL-811H. I know because I went through a dozen or more before I re-tubed it with 572Bs (also Chinese clones, but with a longer half life if used at 1700 volts than 2500-2600 volts.) There are *no* glass transmitting tubes made in NA anymore, be they 811As, 572Bs, 3-500Zs or whatever.

There are two issues here regarding 4CX800As/GU74B tubes:

(1) NOS tubes are hard to find (go ahead and buy them from some anonymous person on eBay -- a great place to get replacement parts for electronic equipment when the vendors and manufactures won't sell you any.)

(2) When you get one, figure out how to condition it or just plug it in and take your chances. If, as someone said, there are plenty out there, and it isn't possible that 1000 amplifiers sucked dry the entire inventory of the former Soviet Union, then tell us where they are (other than eBay.)

I joined this conversation a week ago because I believe ACOM 1000 and ACOM 2000 amplifiers to be the absolute best in their respective power classes. I see a long term problem if we can't get replacement tubes, or if those that we do get require an Electrical Engineer to condition them before use. I'm not trying to start an argument . . . before I bought my amp, I obtained 4 NOS tubes. It really doesn't make a lot of difference to me if they are no longer available. I would like to be assured I can put them on into my amp without damaging it, but that is not the case.

If I were going to buy a new amp based on a 4CX800As/GU74B tube today, and I was told "there are 11 spares on eBay, and in 1990 the former Soviet Union had tons of them, but we don't know where there are now", I'd probably get something based on a 8877.

I think this is something ACOM, QRO, Alpha, Emtron, etc. need to address if they want to keep selling amps. All of our speculation here isn't going to solve much.

2283. Question about optional cooling fan

Yahoo group: acom-list (1999 — 2009)
Date: 2008-01-26 01:50:41 UTC
From: kamarty456
Topic: 2283 Message: 2283

I know the dimension of the fan is 119mm x 119mm -or- about 4 11/16 square.
I plan do get a 24v fan with a bearing not a bushing.

I do not know though, what the best number of blades to get 5 or 7?
I do not know what CFM is suggested I see the fans as low as 35CFM and as high as 105CFM
I also do not know what noise [in db] level most have. I also see fans from 25db to 50db. I know the quietest is the best! I also know noise and airflow go hand in hand! So what is the best recommendation?

Does anyone have a "factory" installed optional fan that can share the specs they use?
And, can those using after market fans please reply with their specs and opinions. In other words if you had an option of what to select what would you have picked?

Thanks,

Marty, ka7gkn

Marty,
I sent you an email last night, but it bounced. Pse give me a valid address to conact you.
Tnx,
Barry W2UP

Hello All,

Take a look at this website. I can't seem to find much more info.
Maybe someone else will have better luck...

Has anyone asked ACOM or QRO? If these tubes are that hard to find then you
would think that ACOM and QRO would know.

Hello,
This is what I got from Acom Europe just a few days ago:

Hi Fernando,

It's a pity that we have GU74B in stock for warranty replacement only and cannot sell as spare ones.
I'm not aware where you could buy from but certainly vendors could be found on the Internet.

Thank you for your so favorable comments on the ACOM 2000A and trust you will enjoy its flawless operation for many more years to come.

Best regards,
Lydia

73s!

Since RF Parts is listed as a stocking distributer by the mfr I don't know why anyone thinks there is a problem. They have been reliable and around for many years. I've bought finals from them for decades. 4CX1000A, 3CX800A7, etc. They provide fast service and reliable tubes.

Hello All,

Take a look at this website. I can't seem to find much more info.
Maybe someone else will have better luck...

http://www.sed-usa.com/index.asp?strType=Content&strPage=4CX800A

http://www.rfparts.com/tubesvet.html

Look here. They say they are the Svetlana distributer with a full line of tubes. BUT!!! for the 4CX800A price they say "CALL".

Their search engine finds very LITTLE.

It's hard to believe they are that hard to find. It would really hurt QRO, Alpha, and Acom who all depend on them. The Tokyo Hi Power solid state amps look better all the time :-)

It *is* hard to believe the entire supply of NOS tubes has dried
up in a year, and that no one in the world is making any new
ones. However, as we all are discovering, if you eliminate eBay, you
can't buy a spare. I strongly doubt RF Parts have any in
stock. Maybe worth an email or a phone call next week to verify this.

I also find it hard to believe there is some sort of collusion
going on to drive the price up. Not that vendors wouldn't love to do
so, just that it would require co-operation world-wide. Something
isn't quite right here. I guess it will sort itself out sooner or later.

Maybe some creative entrepreneur with a lot of spare $$ bought
up every one he (they?) could find, and are quietly sitting on them
waiting until they can sell then for 5 times what they paid for
them. You forgot Emtron, so there are four companies with high end
amplifiers all depending on the availability of one brand of
tube. Something is fishy here! :-)

The best part of this thread is that the 12 guys from the Acom reflector who are hitting the panic button over 4CX800's which are 'drying up' and willing to hoard whatever they can from eBay, are most likely going to feel a little strange when the economy really hits the skids shortly and they find all sorts of supply on the market at very reasonable pricing.. I say relax, don't do it... just kick back and screw it.. the tubes are out there, so hold out until they are fair ;)

Until you have to replace their "finals". My opinion is that solid
state finals are easier to kill than tubes ever were..
Finding older high power FETs or whatever will also be a challenge.

The "conspiracy" part of my psyche says that this is all a
manufacturer's plot to get us to buy new amps.....
Naw they would never do that.

From: Kelly Johnson
Topic: 2239 Message: 2296

You may be right. I've never owned one. My ACOM 1000 is the only amp I've ever owned.

I have a hard time believing that all of the amp manufacturers are conspiring. Besides, even if they were playing this game they would have to have an alternate design in place. Do any of them have an alternate except for th $10K Alpha? You won't see me buying one of those any time soon.

2297. CX800A tubes are available

Yahoo group: acom-list (1999 — 2009)
Date: 2008-01-29 02:44:56 UTC
From: Chris
Topic: 2239 Message: 2297

Argh! I can't take this anymore. Give me 5 quality minutes with Google.....

The 4CX800A's appear to be available for $434. See:
http://www.tube-shop.com/usa/prod_radio_detail.asp?ProductID=326&ProcessType=19

They even ship the next day!

The GU-74B (NOS) also appears to be available for $225:
http://www.tube-shop.com/usa/prod_radio_detail.asp?ProductID=561&ProcessType=19

I have no clue about this company, but here's what I gather:

Around 2003 PM Components Limited (UK) became the world-wide distributor for Svetlana. In the U.S.A. the distributor was suppose to be PM of America located in Memphis, but I could not find a real company by this name. Instead "Tube Shop" appears to be selling the tubes in the U.S. with the tubes still coming from the U.K. Due to litigation, Svetlana in the U.S. is called SED but it's still Svetlana.

Other rumors: The tube is also mfg by a Chinese company, (good luck there), but in 5 minutes I could not track it down.

Pentalabs also appears to sell the tube. They will only conduct business over the phone. http://www.pentalaboratories.com/ Don't know where they get the tube. China?

Alpha Radio Products lists the tube for $325 but out of stock. Don't know what that means. But They have the 8877 for $750 (way cheaper than RF Parts).
http://alpharadioproducts.com/merchant5/merchant.mvc?Screen=CTGY&Store_Code=AS&Category_Code=TU

Of course, you never really know for sure until you order a tube and drop it in the amp.

The UK site says "Sorry, Tube-Shop.Com are unable to sell
Svetlana Tubes to the United States of America." On the same site,
clicking "Buy" for either product gives the following error:

ADODB.Recordset error '800a0cc1'

Item cannot be found in the collection corresponding to the requested name or ordinal.

/usa/UCII_Cart.asp, line 244

Alpha says they have none in stock. That means they really don't have any, or if they do, they won't sell them.

So . . . we are down to phoning PentaLabs and hoping they are not Chinese clones. I doubt Chinese clones exist. They seem to have only gotten into the glass tube market as of yet.

No point in continuing this as there seem to be two camps: those who claim there is no shortage, but can't find any, and those who claim there is and already have spares and don't really care. Both camps seem equally proficient at using Google! :-)

All they have is a socket for the 4CX800A, but if the
GU-84B/4CX2500A were a drop in replacement (from a physical and
electrical standpoint), now there's a tube!

QRO-parts pulled the Gu-74B from their web site over the past week. They cancelled my order for a pair.
